XX

XX Interference RNA agent useful for treating dyslipidemias, coronary artery

PT disease, diabetes, cancer or neurological disease, comprises sense

PT sequence and antisense sequence which has specific modifications.

XX

XX Example 5; SEQ ID NO 2740; 378pp; English.

XX

XX The invention describes a RNA interference (iRNA) agent (I) comprising a

CC sense sequence and an antisense sequence, where the sense sequences have

CC one or more asymmetrical 2'-O alkyl modifications, the antisense

CC sequences have one or more asymmetrical phosphorothioate modifications

CC and the antisense sequence targets a human gene sequence. Also described

CC are: a pharmaceutical preparation comprising (I); reducing (MI) apoB-100

CC levels or glucose-6-phosphatase levels in a subject; producing (I);

CC stabilising (I), involves selecting a sequence with activity and

CC introducing one or more asymmetrical modification in the sequence, where

CC the modification decreases nuclease sensitivity while not decreasing its

CC activity; a kit comprising (I) and instruction for its use; and a device

CC that can be dispense or administer a composition comprising (I). (I) is

CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (MI)

CC

CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.

CC The subject is suffering from a disorder characterised by elevated or

CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted

CC levels of cholesterol, and/or dysregulation of lipid metabolism. The

CC disorder is chosen from the HDL/LDL cholesterol imbalance,

CC dyslipidaemias, hypercholesterolaemia, statin-resistant

CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart

CC disease (CHD) and atherosclerosis. (I) is administered to a subject to

CC inhibit hepatic glucose production or for treating glucose-metabolism-

CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for

CC treating the diseases as mentioned above, cancer (e.g. breast, colon or

CC lung cancer), neurological disease (e.g., Huntington disease or

CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence

CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that

CC can be used to control ApoB gene expression.

 XX New polypeptide, for raising antibodies that recognize hGDMPLP-1 proteins,
 PT or as specific biomolecule capture probes for surface-enhanced laser
 PT desorption ionization, comprises human myosin-like protein hGDMPLP-1.
 XX Disclosure; SEQ ID NO 7247; 214pp; English.
 XX The present invention describes a human genome-derived myosin-like
 CC protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
 CC 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
 CC nucleic acids can be used as probes to detect, characterise and quantify
 CC hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
 CC provide initial substrates for the recombinant engineering of hGDMPLP-1
 CC protein variants having desired phenotypic improvements, and for
 CC expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
 CC used as immunogens to raise antibodies that specifically recognise hGDMPLP
 CC -1 proteins, as standards in assays used to determine the concentration
 CC and/or amount specifically of hGDMPLP proteins, as specific biomolecule
 CC capture probes for surface-enhanced laser desorption/ionisation, as
 CC therapeutic supplement in patients having specific deficiency in hGDMPLP-1
 CC production, and in vaccines or for replacement therapy. The
 CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
 CC disorder associated with the expression of hGDMPLP-1, in particular heart
 CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
 CC The present sequence represents an oligomer used in the screening of the
 CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
 CC The sequence data for this patent did not form part of the printed
 CC specification, but was obtained in electronic format directly from WIPO

 XX
 CC The present invention relates to nucleic acid molecules which modulate
 CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
 CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
 CC and enzymatic nucleic acids such as hammerhead ribozymes, DNazymes,
 CC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
 CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse
 CC transcriptase and/or HBV reverse transcriptase primer sequences, as well
 CC as oligonucleotides that specifically bind the Enhancer I region of HBV
 CC DNA. The nucleic acids may be used to modulate the expression of HBV
 CC genes and HBV viral replication. Also disclosed is a method for screening

CC compounds and/or potential therapies directed against HBV, and compounds
CC that modulate the expression and/or replication of HCV. The compounds and
CC methods of the invention are useful for the treatment of degenerative and
CC disease states related to HBV and HCV infection, replication and gene
CC expression such as cirrhosis, liver failure, and hepatocellular
CC carcinoma. The present sequence represents a substrate for one of the HCV
CC DNase/minus strand DNase sequences disclosed in the present
CC invention

XX Novel myosin-like protein-1, useful for treating or preventing disorder

XX associated with decreased expression or activity of human genome-derived

PT myosin-like protein-1 such as disorder of heart and/or skeletal muscle

PT function.

XX Disclosure; SEQ ID NO 7247; Opp; English.

CC The invention relates to a novel polypeptide (I) comprising a sequence
CC (SI) of myosin-like protein-1 (hGDMPL-1) having 2568 amino acids fully
CC defined in the specification, a fragment of at least 8 amino acids of
CC (SI), 95% deviation from (SI) which are conservative substitutions, and
CC 65% identity to (SI). A polypeptide of the invention acts as an agonist or
CC antagonist of hGDMPL-1, or as an inhibitor of hGDMPL-1 activity. A
CC pharmaceutical composition of the invention is useful for treating or
CC preventing a disorder associated with decreased expression or activity of
CC hGDMPL-1, such as a disorder of heart and/or skeletal muscle function.
CC The present sequence represents a 17-mer nucleotide, used in the
CC invention for scanning the sequence represented in ACN63103

 XX Enzymatic nucleic acid molecules having a hammer-head motif - used for
 PT the treatment of arthritis, induction of graft tolerance or treatment of
 PT auto-immune diseases.
 XX Claim 10; Page 218; 307pp; English.
 XX The present invention describes a novel enzymatic nucleic acid (ENA)
 CC having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues
 CC; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least
 CC ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's
 CC can inhibit collagenase and stromelysin production in the synovial
 CC membrane of joints for the treatment or prevention of arthritis,
 CC particularly osteoarthritis or rheumatoid arthritis. The ENA's can also
 CC be used to treat antigen presenting cells of a donor to induce tolerance
 CC in a recipient to an alloantigen of a donor. They can also be used for
 CC enhancing graft tolerance or for treating autoimmune disease, and for
 CC treating allergies and other inflammatory conditions. The ENA's can also
 CC be used in diagnosis. Ribozyme therapy impacts on the expression of
 CC stromelysin without introducing the non-specific effects upon gene
 CC expression which accompany treatment with retinoids and dexamethasone.
 CC The concentration of ribozyme required to affect a therapeutic treatment
 CC is lower than that required of antisense molecules, and is highly
 CC specific. The present sequence is used in the exemplification of the
 CC present invention

 XX Novel biallelic markers used to construct a high density disequilibrium
 PT map of the human genome.
 XX Claim 9; Page 2569; 2745pp; English.
 XX AAZ65654 to AAZ69578 represent human biallelic markers from the present
 CC invention, which contain a polymorphic base at position 24 of their
 CC nucleotide sequences. AAZ69579 to AAZ7440 represent amplification
 CC primers for the biallelic markers. The biallelic markers of the invention
 CC have a variety of uses: they can be used for high density mapping of the
 CC human genome, and in complex association studies and haplotyping studies
 CC which are useful in determining the genetic basis for disease states.
 CC Compositions and methods of the invention can also be useful for the
 CC identification of the targets for the development of pharmaceutical
 CC agents and diagnostic methods, as well as the characterisation of the
 CC differential efficacious responses to and side effects from
 CC pharmaceutical agents acting on a disease as well as other treatment.

XX DR New antisense oligonucleotides for modulating the expression of inducible

XX PT nitric oxide synthase in cells or tissues, particularly useful for

PT treating e.g. immunological, cardiovascular or neurological disorders, or

PT ischemia.

XX PS Claim 3; Page 84; 144pp; English.

XX CC The invention relates to antisense compounds, especially

CC oligonucleotides, which are targeted to a nucleic acid encoding inducible

CC nitric oxide synthase and which specifically hybridize to and modulate

CC expression of inducible nitric oxide synthase. The antisense compounds

CC have immunomodulator, antidiabetic, cardiovascular, cardiac,

CC neuroprotective, disorder and vasotropic activity. The antisense

CC oligonucleotides are useful for inhibiting the expression of inducible

CC nitric oxide synthase in cells or tissues. In particular, the antisense

CC oligonucleotides are useful for treating diseases or disorders associated

CC with inducible nitric oxide synthase, e.g. diabetes, immunological

CC disorder, cardiovascular disorder, neurological disorder or

CC ischemia/reperfusion injury. The antisense oligonucleotides are also

CC useful for research and diagnostics. The present sequence is that of an

CC antisense 2'-O-methoxyethyl gapmer oligonucleotide with a

CC phosphorothioate backbone, a central "gap" region of ten nucleotides

CC flanked by four nucleotide 2'-MOE (2'-methoxyethyl) wings (cytidine

CC residues in the 2'-MOE wings are 5-methylcytidines) and targeted to human

CC inducible nitric oxide synthase (NOS) mRNA (AAH47959)

XX DR Biological array for analyzing biological molecules, has frozen matrix

XX PT formed from a temperature-sensitive material with several wells in it,

PT and biological samples and internal standard preparations contained in

PT the wells.

XX Example 4; Page 45; 111pp; English.

XX PS The invention relates to a novel biological array or microarray

XX CC comprising a frozen matrix formed of a temperature-sensitive material

CC which has a number of wells disposed in it. One or more biological

CC samples may be disposed within the wells and retained by the frozen

CC matrix surrounding the wells. Optionally, one or more internal standard

CC preparations may be contained within one or more of the wells. The

CC biological array of the invention may be useful for the detection of a

CC biological molecule i.e. a polynucleotide or a polypeptide, such as a

CC soluble receptor or extracellular domain (ECD) of a receptor. Such

CC molecules may be detected within a variety of biological samples

CC including normal, diseased or treated cells or tissues of blood, muscle

CC or breast. The biological array may be useful during detection of disease

CC within a biological sample, for example, breast cancer may be detected

CC via the identification of Her2 (ErbB2) or VEGF (vascular endothelial

CC growth factor) overexpression within a sample. Furthermore, the method of

CC array construction disclosed herein eliminates the need for a barrier

CC material between an array matrix and a biological sample and also the

CC need to chemically process a sample before use. This allows the integrity

CC of array samples to be maintained and makes the process of constructing a

CC biological array more cost effective and less time consuming. The current

CC sequence is that of the fluorogenic probe of the invention which was used

CC to isolate the human Her2 RNA

XX
XX PT DAZ genes associated with reduced sperm counts - useful for diagnosing
XX and treating azoospermia or oligospermia.
XX
XX PS Example; Col 9-10; 25pp; English.
XX
XX CC This sequence is a PCR primer for a sequence tagged site (STS) present on
XX the Y chromosome. This primer was used to isolate the DAZ gene of the
XX invention, which is part of the DAZ family of genes, and was isolated
XX from interval 6D and/or 6E of the distal portion of the long arm of the Y
XX chromosome. Alteration of the DAZ gene (A) is known to be associated with
XX reduced sperm counts. Hence, the invention may be used to diagnostically
XX identify males with a condition that results in a reduced sperm count
XX such as oligospermia or azoospermia (i.e. where sperm count= 0 to 20
XX million semen per ml), in whom the gene (A) has been altered. It may also
XX be used therapeutically in gene therapy treatments to remedy fertility
XX disorders associated with the alteration or deletion of (A).
XX Additionally, (A) may be useful in designing or identifying agents which
XX may function as a male contraceptive by inducing reduced sperm count. It
XX also has an application as a research tool, as the DNA has been localised
XX to interval 6E of the distal portion of the long arm of the human Y
XX chromosome, it can, therefore, function as a marker for that interval.
XX Little is known about the causes of reduced spermatogenesis, especially
XX among the 10% of men who visit fertility clinics and are diagnosed as
XX having oligospermia (or azoospermia) of unknown origin. Although various
XX diagnostic tests and treatments are currently available, improved methods
XX are still needed. The invention provides new diagnostic methods and
XX treatments for oligospermia resulting from alteration or deletion of (A)

XX New nucleic acid, useful for diagnosis and treatment of reduced sperm
PT count, is derived from the human DAZ or DAZH genes.
XX
XX Claim 12; Col 17-18; 110pp; English.
XX
XX The invention relates to a family of human genes referred to as the DAZ
CC gene family, and to a functional DAZ homologue, DAZH. Members of the DAZ
CC gene family are clustered in the same region of the Y chromosome. In
CC particular, the invention relates to an isolated DAZ gene (AAZ92499),
CC present in interval 6D and/or 6E of the distal portion of Yq, mutations
CC in which are associated with reduced sperm count. The DAZH gene
CC (AAZ92580) is located on chromosome 3; however, the entire DAZ gene
CC family, including DAZH is expressed in germ cells. DAZ and DAZH
CC nucleotide sequences may be used as a source of primers and probes for
CC the diagnosis of cases of reduced sperm count associated with alteration
CC or deletion of the DAZ gene. They are also used as human chromosome Y
CC markers. Functional DAZ genes can be used in gene therapy for treating
CC reduced sperm counts. Sequences AAZ92502-292573 represent PCR primers
CC used in the exemplifications of the invention to test for Y-specific STSS
CC (sequence tagged sites)

XX
XX Sequence specific inhibition of DNA synthesis - by triplex-forming
PT oligonucleotide(s), for detection of oncogene mutation(s) and treatment
PT of e.g. HSV, Hepatitis C and Papillomavirus infection.
XX
XX Example 4; Page 42; 78pp; English.
XX
XX Specifically designed oligodeoxyribonucleotides form triplexes in single-
CC or double-strand DNA at homopurine-homopyrimidine targets. These

CC triplexes block in vitro DNA synthesis by all DNA polymerases studied,
CC including Sequenase3, Taq, Vent, and Pol I. A similar phenomenon occurs
CC when DNA polymerases are supplemented with accessory replication
CC proteins, including SSB protein. Replication blockage is highly sequence-
CC specific and even one or two point substitutions within either the target
CC sequence or the oligonucleotide abolish the effect. Sequence-specific
CC blocking of DNA replication in vivo is facilitated by the methods and
CC compositions of the present invention. The present sequence is the ORF-Ec
CC human papilloma virus (HPV) target (position 436-452 in HPV57 and 438-452
CC in HPV2) for triplex-forming oligonucleotides AAT35030-31

XX
XX New polypeptide, for raising antibodies that recognize hGDMPLP-1 proteins,
PT or as specific biomolecule capture probes for surface-enhanced laser
PT desorption ionization, comprises human myosin-like protein hGDMPLP-1.
XX
XX Disclosure; SEQ ID NO 8973; 214pp; English.
XX
XX The present invention describes a human genome-derived myosin-like

CC protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-1
 CC 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
 CC nucleic acids can be used as probes to detect, characterise and quantify
 CC hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
 CC provide initial substrates for the recombinant engineering of hGDMPLP-1
 CC protein variants having desired phenotypic improvements, and for
 CC expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
 CC used as immunogens to raise antibodies that specifically recognise hGDMPLP
 CC -1 proteins, as standards in assays used to determine the concentration
 CC and/or amount specifically of hGDMPLP proteins, as specific biomolecule
 CC capture probes for surface-enhanced laser desorption/ionisation, as
 CC therapeutic supplement in patients having specific deficiency in hGDMPLP-1
 CC production, and in vaccines or for replacement therapy. The
 CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
 CC disorder associated with the expression of hGDMPLP-1, in particular heart
 CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
 CC The present sequence represents an oligomer used in the screening of the
 CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
 CC The sequence data for this patent did not form part of the printed
 CC specification, but was obtained in electronic format directly from WIPO
 CC at ftp.wipo.int/pub/published_pct_sequence

XX
XX A new antisense compound for inhibiting the expression of human G-alpha-
PT 16 and treating, preventing or delaying infections, inflammation or
PT hyperproliferative disorders such as cancer.
XX
XX Example 15; Page 73; 100pp; English.
XX
CC The present sequence is an antisense oligonucleotide used to modulate
CC expression of G-alpha-16. G-alpha-16 is a human G protein which interacts
CC differentially with several receptor types including members of the
CC opiod and chemokine receptor families. A series of antisense
CC oligonucleotides have been designed to target different regions of the
CC human G-alpha-16 RNA. They may be used to inhibit the expression of G-
CC alpha-16 in human cells and tissues and thus to treat diseases associated
CC with G-alpha-16, such as hyperproliferative disorders, especially cancer.
CC Infections, inflammation or tumour formation can be prevented or delayed.
CC The compounds can be used in research and diagnostics in sandwich and
CC other assays. Note: The sequence has a phosphorothioate backbone and may
CC be either an oligodeoxynucleotide or a chimeric oligonucleotide
CC containing 2'-methoxyethyl (2'-MOE) wings and a deoxy gap. The ISIS
CC number given above corresponds to the oligodeoxynucleotide sequence

XX (RIBO-) RIBOZYME PHARM INC.
 XX Stinchcomb DT, Draper K, Mcswiggen J, Jarvis T;
 PI WPI; 1996-010927/01.
 XX New enzymatic nucleic acid molecules - cleave RNA produced by e.g. c-myb,
 PT for treating restenosis or cancer.
 XX Claim 1; Page 64; 128pp; English.
 XX The present sequence represents the preferred target sequence for an
 CC enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves
 CC the human c-myb sequence at the base position indicated in the descriptor
 CC line. The c-myb sequence was screened for optimal ribozyme target sites
 CC using a computer folding algorithm, and regions of the mRNA which did not
 CC form secondary folding structures and contained potential ribozyme
 CC cleavage sites were identified. Ribozymes were synthesised and their
 CC activities optimised by either varying the length of the binding arms or
 CC by modification to prevent degradation by nucleases. The ribozymes cleave
 CC the c-myb sequence and can be used to prevent smooth muscle cell
 CC hyperproliferation in restenosis, especially after coronary angioplasty,
 CC and in cancers

 XX Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
 PT stability- useful for treating e.g. tumour angiogenesis, psoriasis,
 PT rheumatoid arthritis, etc., in a human patient.

XX Claim 4; Page 144; 218pp; English.
 XX
 CC The present invention describes nucleic acid molecules which modulate the
 CC synthesis, expression and/or stability of a mRNA encoding 1 or more
 CC receptors of vascular endothelial growth factor (VEGF). A patient
 CC (preferably human) having a condition associated with the level of the
 CC fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
 CC receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
 CC angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
 CC treated by administering the nucleic acid molecule or the expression
 CC vector to the patient. AAX67275 to AAX75752 represent specific examples
 CC of nucleic acid molecules from the present invention

 XX Enzymatic and antisense nucleic acid inhibition of repressor genes,
 PT useful for producing e.g. granulocyte colony stimulating factor protein,
 PT interferon alpha and erythropoietin.
 XX
 PF Claim 37; Page 62; 164pp; English.
 XX
 CC The present invention relates to enzymatic and antisense nucleic acid
 CC molecules that act as inhibitors of the expression of repressor genes
 CC encoding the TR2 Orphan receptor, EAP3/COUP-TF-1, the GATA transcription
 CC factor gene, IRP-2 and/or the CAAT Displacement Protein (CDP).
 CC Inhibition of the repressors removes prevents inhibition (and
 CC consequently increases expression of) genes involved in the production of
 CC erythropoietin, granulocyte colony stimulating factor protein and
 CC interferon alpha

 PT Oligonucleotide for targeted alterations of genetic sequences and for
 PT treating cystic fibrosis, comprises at least one mismatch and chemical
 PT modification.
 XX
 PS Claim 7; Page 233; 294pp; English.
 XX
 CC The present invention provides single-stranded oligonucleotides which can
 CC be used for the targeted alteration of genomic sequences, where the
 CC oligonucleotide has at least one mismatch compared with the genomic
 CC sequence to be altered. In particular, these sequences are directed at
 CC the following genes: adenosine deaminase; p53; beta-globin,
 CC retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A
 CC (CDKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus
 CC 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6,
 CC apolipoprotein E (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase
 CC (UGT1), amyloid precursor protein (APC), presenilin-1 (PSEN1) and
 CC presenilin-2 (PSEN2). These can be used in the gene therapy of diseases
 CC such as cancer, adenosine deaminase deficiency, cystic fibrosis,
 CC haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia,
 CC Alzheimer's disease, melanoma, adenomatous polyposis of the colon and
 CC various syndromes. The present sequence is one of the gene correcting
 CC oligonucleotides of the invention

XX PS Disclosure; SEQ ID NO 7698; 214pp; English.
XX CC The present invention describes a human genome-derived myosin-like
CC protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
CC 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
CC nucleic acids can be used as probes to detect, characterise and quantify
CC hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
CC provide initial substrates for the recombinant engineering of hGDMPLP-1
CC protein variants having desired phenotypic improvements, and for
CC expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
CC used as immunogens to raise antibodies that specifically recognise hGDMPLP
CC -1 proteins, as standards in assays used to determine the concentration
CC and/or amount specifically of hGDMPLP proteins, as specific biomolecule
CC capture probes for surface-enhanced laser desorption ionisation, as
CC therapeutic supplement in patients having specific deficiency in hGDMPLP-1
CC production, and in vaccines or for replacement therapy. The
CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
CC disorder associated with the expression of hGDMPLP-1, in particular heart
CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
CC The present sequence represents an oligomer used in the screening of the
CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO

XX
XX Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL
-1, useful for treating disorders associated with decreased expression or
activity of human POSHL1.
XX
XX Example 2; SEQ ID NO 303; 60pp + Sequence Listing; English.
XX
XX The invention relates to an isolated SH3 domain (POSH)-like signalling
protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino
acids (S1, AB883999), a sequence having 65% sequence identity to (S1),
CC (S1) having 95% deviations, especially conservative substitutions or a
CC fragment of the sequences comprising at least 8 contiguous amino acids.
CC Human POSHL 1 is a proto-oncogene/oncogene product that functions as an
CC adaptor protein that interacts with Rho family small GTPases as well as
CC downstream components of the signal transduction pathway. (I) is useful
CC for identifying a specific binding partner. (II) and nucleic acids (II)
CC encoding (I) are useful for diagnosing, monitoring disease and treating
CC caused by altered expression of human POSHL1 including diagnosing and
CC treating cancer, they useful in the development of vaccines and (II) is
CC useful in gene therapy. (II) is useful for constructing microarrays which
CC are useful for measuring and for surveying gene expression and creating
CC transgenic non-human animals capable of producing the proteins. The
CC present sequence is that of a scanning oligonucleotide useful in examples
CC of the invention. Note: The present sequence did not form part of the
CC printed specification, but is based on sequence information supplied to
CC Derwent by the European Patent Office

 XX Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of
 PT individuals e.g. by determining immunogenetic differences when
 PT transplanting between them.
 XX Claim 10; Page 294; 345pp; Japanese.
 XX The invention relates to a typing kit for judging human leukocyte antigen
 CC (HLA) genotype of a sample by hybridising a substrate on which 10-24 base
 CC oligonucleotides (ABL30512-ABL31809) originating in the sequences of
 CC genes e.g. belonging to HLA class I antigens on human genome and
 CC containing gene polymorphisms as alloantigens have been immobilised as
 CC primers for amplification of cleaved nucleic acids relating to gene
 CC polymorphisms. The method is useful for judging HLA genotypes of
 CC individuals by determining immunogenetic differences before transplanting
 CC organ and tissue, providing genetic information to decide compatibility of
 CC pancreas, Langerhans islet in pancreas and cornea, susceptibility
 CC diagnosis of genetic diseases and identifying individuals

 PT Enzymatic polynucleotide that down regulates expression of chloride
 channel calcium activated gene, useful for treating Chronic obstructive

PT pulmonary disease (COPD), chronic bronchitis and asthma.
 XX Claim 4; Page 61; 152pp; English.
 XX The invention relates to enzymatic nucleic acid molecules that down
 CC regulate expression of chloride channel calcium activated 1 (CLCA1) genes
 CC by cleaving RNA derived from the genes. The nucleic acid sequences are
 CC useful as pharmaceutical agents for treating conditions such as chronic
 CC obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic
 CC fibrosis, obstructive bowel syndrome and any other diseases or conditions
 CC that are related to or will respond to the levels of CLCA1 in a cell or
 CC tissue. The sequences are useful for reducing CLCA1 activity in a cell,
 CC hence, are useful for treatment of a patient having a condition
 CC associated with the level of CLCA1, where the invention further comprises
 CC the use of one or more therapies under conditions suitable for the
 CC treatment, for example, oxygen therapy, bronchodilators, corticosteroids,
 CC anticholinergics, vaccinations, acetylcysteine and mucokinetic agents. The
 CC nucleic acids of the invention are also used as diagnostic tools to
 CC examine genetic drift and mutations within diseased cells or to detect
 CC the presence of CLCA1 RNA in a cell. This sequence represents an
 CC enzymatic nucleic acid molecule of the invention

CC The invention relates to nucleic acid molecules that modulate replication
 CC of the West Nile Virus (WNV). The nucleic acid molecules are useful for
 CC treating a condition related to WNV infection e.g. pancreatitis,
 CC encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
 CC liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid
 CC molecule is selected from the group of ribozymes consisting of
 CC Hammerhead, Inozyme, G-cleaver, DNazyme, Amberzyme and Zinzyme. The
 CC nucleic acid molecules further comprise at least five ribose residues, at
 CC least ten 2'-O-methyl modifications, phosphorothioate linkages on at
 CC least three of the 5' terminal nucleotides and a 3' end modification of a
 CC 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
 CC are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
 CC in the specification. The present sequence is that of a nucleic acid
 CC molecule of the invention

CC The invention relates to a novel isolated nucleic acid that encodes a
 CC protein with a chromatin organisation modifier (CHROMO) domain. The
 CC polynucleotide of the invention demonstrates cytostatic activity and may
 CC be useful for preparing a composition for treating or preventing a
 CC disorder associated with decreased or increased expression or activity of
 CC PCCP1 (prostate cancer candidate protein 1), such as a tumour, as well as
 CC during gene therapy and vaccine production procedures. The current
 CC sequence is that of the human PCCP1-related DNA fragment SEQ ID 8-
 CC directed probe of the invention. Note: The current sequence is not shown

 PT Novel enzymatic nucleic acid that down-regulates expression of neurite
 PT growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
 PT protein kinase PKR genes, for treating cancer and inflammatory disease.
 XX
 PS Claim 9; SEQ ID NO 936; 317pp; English.

CC The invention comprises nucleic acids (e.g. antisense oligonucleotides)
 CC that down regulate the expression or inhibit the function of a receptor
 CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
 CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
 CC invention are useful for treating: cerebrovascular accident, central
 CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
 CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
 CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
 CC disease, lupus, multiple sclerosis, transplant/graft rejection,
 CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
 CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
 CC nucleic acids of the invention are also useful for down-regulating the
 CC expression of a target gene and as a diagnostic tool to examine genetic
 CC drifts and mutations within diseased cells or to detect the presence of a
 CC target RNA in a cell. The present RNA sequence represents a human NOGO
 CC receptor amberyyme substrate sequence.

XX Novel myosin-like protein-1, useful for treating or preventing disorder
PT associated with decreased expression or activity of human genome-derived
PT myosin-like protein-1 such as disorder of heart and/or skeletal muscle
PT function.
XX Disclosure; SEQ ID NO 7813; Opp; English.
XX The invention relates to a novel polypeptide (I) comprising a sequence
CC (S1) of myosin-like protein-1 (hGDMPLP-1) having 2568 amino acids fully
CC defined in the specification, a fragment of at least 8 amino acids of
CC (S1), 95% deviation from (S1) which are conservative substitutions, and
CC 65% identity to (S1). A polypeptide of the invention acts as an agonist or
CC antagonist of hGDMPLP-1, or as an inhibitor of hGDMPLP-1 activity. A
CC pharmaceutical composition of the invention is useful for treating or
CC preventing a disorder associated with decreased expression or activity of
CC hGDMPLP-1, such as a disorder of heart and/or skeletal muscle function.

CC The present sequence represents a 17-mer nucleotide, used in the
CC invention for scanning the sequence represented in ACN63103

 PT Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
 PT stability - useful for treating e.g. tumour angiogenesis, psoriasis,
 PT rheumatoid arthritis, etc., in a human patient.
 XX
 PS Claim 4; Page 185; 218pp; English.
 XX
 CC The present invention describes nucleic acid molecules which modulate the
 CC synthesis, expression and/or stability of a mRNA encoding 1 or more
 CC receptors of vascular endothelial growth factor (VEGF). A patient

CC (preferably human) having a condition associated with the level of the
 CC fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
 CC receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
 CC angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
 CC treated by administering the nucleic acid molecule or the expression
 CC vector to the patient. AAX67275 to AAX75752 represent specific examples
 CC of nucleic acid molecules from the present invention

XX New large comb-type branched polynucleotides - useful as amplification

XX multimers in nucleic acid hybridisation assays.

XX Example 6; Col 24; 33pp; English.

The invention relates to a large comb-type branched polynucleotide of
 formula: 3'-A-S-(S'-X')^m-S'-5', where X' is a branched site joined to -
 (R)n-S'-E-L; A is an oligonucleotide complementary to an analyte nucleic
 acid sequence; S is a first spacer segment of 1-50 linked monomers where
 each monomer is selected from nucleotides and a cleavable linker R; S' =
 a branching site spacer segment of 0-15 linked monomers where each of the
 monomers is selected from nucleotides and cleavable linker R; X' = a
 multifunctional nucleotide that provides a branch site; m = 1-100; S' =
 a second spacer segment of 0-10 linked monomers where each of the
 monomers is selected from nucleotides and cleavable linker R; R = a
 cleavable linker molecule; n = 0 or 1; S'' = a third spacer segment of 0
 -10 linked monomers where each of the monomers is selected from
 nucleotides and cleavable linker R; E = an oligonucleotide segment of 5-
 10 nucleotides; L = an oligonucleotide containing 2-10 iterations of a
 nucleotide sequence complementary to a labelled nucleic acid probe. The
 invention also relates to a branched nucleic acid polymer. The poly-
 nucleotides are useful as amplification multimers in nucleic acid
 hybridisation assays used for genetic research, biomedical research and
 clinical diagnostics. Since the polynucleotide multimers include a large
 number (at least 20) iterations of a sequence that are available for
 specific hybridisation, they permit a greater degree of amplification and
 decrease the threshold level of a detectable analyte. The present
 sequence is shown in the specification. (Updated on 25-MAR-2003 to
 correct PF field.)

PT Haplotype analyses for indirect detection of glaucoma.
XX
PS Claim 18; Page 28; 41pp; English.
XX
CC This sequence represents a PCR primer used in the method of the
CC invention. The method is for detecting the presence of alleles for
CC glaucoma comprising haplotype analysis of human chromosome 2 and 6
CC respectively, where the haplotypes are associated with loci GLC1B and
CC GLC6p25 respectively. The primers are used to amplify gene sequences to
CC generate information necessary to compile haplotype profiles. The
CC haplotype profiles can be used to detect presymptomatic and symptomatic
CC glaucoma. They can also be used to localise, isolate and identify the
CC GLC1B and GLC6p25 loci so that detection of individuals with glaucoma is
CC enhanced. The haplotype analyses also provide means for identification
CC and following of mutant alleles in pedigrees or populations.
CC Identification of presymptomatic individuals using the methods allows
CC intervention in the disease process and obviates the impact of inheriting
CC a mutant allele causing disease, by medically disrupting the initiation
CC or progression of the disease

Novel polypeptides used to treat clinical conditions resulting from
ubiquitin conjugating enzyme 7, UBC7, mediated protein degradation.
Disclosure; Page 15; 37pp; English.
This primer is one of a pair (see also AAZ20074) used to screen the NIGMS
human/rodent somatic cell hybrid panel, and the Genebridge 4 radiation
hybrid-mapping panel for the chromosomal localisation of the novel human
gene (see AAZ20069) coding for ubiquitin conjugating enzyme 7 (hUBC7, see
RAY31983). The gene mapped to chromosome 21 at 21q22. The invention
provides hUBC7 nucleic acids, protein, peptides and antibodies, a method
of screening for modulator compounds, a method of monitoring degradation
of cystic fibrosis transmembrane conductance regulator protein, and a
pharmaceutical composition comprising a UBC7 nucleic acid or protein used
to treat clinical conditions resulting from hUBC7 mediated protein
degradation, e.g. cystic fibrosis

XX
XX Improved nucleic acid hybridisation assays - using large comb-type
PT polypeptide(s).
XX
XX Example 6; Col 23; 31pp; English.
PS
XX
CC The present sequence is used in the synthesis of a comb-type branched
CC polynucleotide. The large comb-type branched polynucleotide of the
CC invention comprises a polynucleotide backbone having at least 15
CC multifunctional nucleotides each defining a sidechain site and pendant
CC polynucleotide sidechains extending from the multifunctional nucleotides,
CC each comprising iterations of an single stranded oligonucleotide unit
CC capable of binding specifically to a second single-stranded
CC polynucleotide sequence. The total number of iterations in all sidechains
CC is at least 20. The first single-stranded polynucleotide sequence is a
CC labelled polynucleotide, directly or indirectly linked to a nucleic acid
CC analyte. In the nucleic acid hybridisation assay of the invention, the
CC labelled nucleic acid probe is hybridised to the branched polymeric
CC nucleotide via the second single-stranded oligonucleotide unit. The comb-
CC type branched polynucleotides are used as amplification multimers in
CC nucleic acid hybridisation assays and other assays such as direct,
CC indirect and sandwich assays

DR WPI; 1999-405178/34.
XX
XX Use of a prostate cancer associated gene and biallelic markers derived
PT from it.
XX
XX Claim 4; Page 353; 385pp; English.
PS
XX
XX The invention relates to a mammalian PGI gene and protein, and a set of
CC PGI biallelic markers. The PGI polynucleotide and biallelic markers are
CC used in a hybridisation assay, a sequencing assay, or in an allele-
CC specific amplification assay for determining the identity of a nucleotide
CC at a PGI-related biallelic marker. The methods can be used to detect and
CC to assess the risk of developing cancer or prostate cancer. Early-stage
CC diagnosis of prostate cancer relies on prostate specific antigen (PSA)
CC dosage. However, the effectiveness of this is limited due to its
CC inability to discriminate between malignant and non-malignant affections
CC of the organ. A need exists for both a reliable diagnostic procedure
CC which would enable early-stage diagnosis, and for preventative and
CC curative treatments of the disease. The PGI gene can be used for
CC detection of prostate cancer, and the risk of developing it in the
CC future, and can also be used to determine therapies for the disease

 PT Transforming Mycobacterium strains for positive selection of allelic
 PT exchange mutants, involves transfecting cells with vector comprising
 PT marker gene and transposon and selecting in medium containing sucrose.
 XX
 PS Disclosure; Col 16; 29pp; English.
 XX
 CC The present sequence is a sequencing primer based on transposon IS1096.
 CC It was used to sequence double-stranded plasmid DNA in a process for
 CC replacing a nucleotide sequence in the genome of a slow growing
 CC Mycobacterium strain. The process comprises transfecting Mycobacterium
 CC with a vector containing SacB gene coding for levane saccharase enzyme
 CC and selecting clones of transformed Mycobacteria by propagating the
 CC clones in a culture medium supplemented with sucrose. The method is
 CC useful for inserting a transposon in the genome of a Mycobacterium
 CC strain. Protective antigens, e.g. for use in BCG vaccine strains, may be
 CC cloned into the Mycobacterium genome. The process is also useful for
 CC random inactivation of genes coding for a protein involved in the
 CC virulence of a pathogenic mycobacterium strain. The method facilitates an
 CC increase of the proportion of allelic exchange mutants, making the
 CC screening of transformants easier

 PT New antisense compounds that limit the expression of human TRADD protein,
 PT useful in the treatment and diagnosis of cancer, inflammation and septic
 PT shock.
 XX
 PS Claim 3; Page 52; 85pp; English.
 XX
 CC The intracellular protein TRADD has been identified as a critical link
 CC between tumour necrosis factor (TNF) receptor binding and downstream
 CC activation of NF-kappa-B. Overexpression of native TRADD activates NF-
 CC kappa-B in the absence of TNF and dominant negative mutants of TRADD
 CC block TNF-induced NF-kappa-B activation. A second effect of TNF in many
 CC cell types is the induction of apoptosis (programmed cell death). TRADD
 CC overexpression has been shown to mimic TNF induction of apoptosis as
 CC well. Data indicates that TRADD and other downstream effector proteins
 CC are the rate limiting step of TNF action and would therefore serve as the
 CC most efficient targets for inhibition of TNF-induced events. Antisense
 CC oligonucleotides capable of inhibiting TRADD function may therefore be
 CC useful in a number of therapeutic, diagnostic and research applications.
 CC Inhibiting expression of TRADD by contacting human cells or tissues with
 CC the antisense compound may be used to treat a disease or condition
 CC associated with TRADD expression, for example, septic shock,
 CC inflammation, or cancer. TRADD antisense oligonucleotides of varying
 CC inhibitory capabilities are listed in GENESEQ records AA293438-293517.
 CC The antisense oligonucleotides exhibit enhanced inhibitory capabilities
 CC when they have 2'-MOE wings and a deoxy gap

XX Determining a predisposition to epilepsy and/or development of epilepsy
XX comprises determining the genotype of SCN1A, SCN2A and/or SCN3A, or a DNA
XX variant, equivalent, or mutation which shows a linkage disequilibrium.
XX
XX Example 5; Fig 6; 268pp; English.
XX
XX The present invention describes a method (M1) of determining an
XX individual's predisposition to epilepsy and/or development of epilepsy,
XX as well as predicting the individual's response to medication. The method
XX comprises determining the genotype of at least one gene selected from
XX SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation which
XX shows a linkage disequilibrium. SCN1A, SCN2A and SCN3A are all sodium
XX channel genes located on chromosome 2. The idiopathic generalised
XX epilepsy (IGE) gene is more specifically localised on chromosome 2q23-
XX q31. Compounds identified as modulators of the biological activity of
XX SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating epilepsy
XX or other neurological disorders. They have anticonvulsant and
XX neuroprotective activities. AAH5763 to AAH56164 and AAH99674 to AAH99679

PT Novel isolated Fanconi anemia protein complex polypeptide, termed FANCD2,
PT useful for treating Fanconi anemia pathway defect in cell target or for
PT treating patient with defective FANCD2 gene.
XX
XX
PS Claim 6; Page 43; 103pp; English.
XX
XX
CC The invention relates to an isolated Fanconi anemia protein complex
CC (FANCD2) polypeptide. The FANCD2 protein comprises a sequence of 1472
CC amino acids fully defined in the specification, its 90% identical
CC sequence, a sequence encoded by a polynucleotide that is at least 90%
CC identical to sequences given in specification such as a 5127 base pair
CC sequence, or a fragment which is at least 50 amino acids in length. The
CC FANCD2 protein is useful for treating an FA pathway defect in a cell
CC target or for treating a patient with a defective FANCD2 gene. The FANCD2
CC gene is useful for making a recombinant expression vector. The FANCD2
CC protein and its gene are useful as a novel target for therapeutic
CC development, and in diagnostic test and screening assays for diseases
CC associated with DNA repair and cell cycle abnormalities such as Fanconi
CC anemia, Bloom's syndrome, Cockayne's syndrome, Hereditary non-polyposis
CC colon cancer, ataxia telangiectasia and Xeroderma pigmentosum. The FANCD2
CC gene is useful in producing probes and primers for screening patients in
CC genetic based test, for diagnosing Fanconi anemia and cancer, for
CC preparing an experimental mouse model for use in screening new
CC therapeutics for treating conditions involving defective DNA repair, and
CC in gene therapy methods. A recombinant vector containing the FANCD2 gene
CC of the invention is useful in gene therapy. This polynucleotide sequence
CC represents a PCR primer of FANCD2 relating to the invention

XX Diagnosing or determining cancer or increased risk of cancer in a
XX patient, by testing Fanconi Anemia/BRCA pathway gene or protein for a
XX cancer-associated defect, that indicates cancer or increased risk of
XX cancer.
XX
XX Example 9; SEQ ID NO 104; 160pp; English.
XX
XX The invention relates to a novel method of diagnosing or determining if a
XX patient has cancer or is at increased risk of cancer, involving testing a
XX Fanconi Anaemia (FA)/BRCA pathway gene or protein for the presence of a
XX cancer-associated defect, where the presence of one or more cancer-
XX associated defects is indicative of cancer or an increased risk of cancer
XX in the patient. The method of the invention has cytostatic activity. The
XX method is useful for determining if a patient has cancer, or is at

CC increased risk of developing cancer, e.g. breast, ovarian or prostate
CC cancer. A microarray of the invention is useful for determining if a
CC patient has cancer, or is at increased risk of developing cancer, by
CC hybridising a nucleic acid sample to the nucleic acid sequences from the
CC array, and detecting the presence of mutations in FA/BRCA pathway genes
CC in the nucleic acid sample from the patient, where detecting the presence
CC of mutations is indicative of a patient who has cancer, or is at
CC increased risk of developing cancer. A method of the invention is useful
CC for screening a chemosensitising agent, and the agent obtained is useful
CC for treating a patient having a cancer. The present sequence is used in
CC the exemplification of the invention.

PT Identifying a pathogen in a biological sample, useful in medical
PT diagnosis, comprises amplifying a nucleic acid from the sample with a
PT pair of intelligent primers, and determining the molecular mass of the
PT amplification product.
XX
PS Example 15; SEQ ID NO 143; 228pp; English.
XX
CC This invention relates to a novel method for the rapid identification of
CC pathogens occurring in environmental samples or biological samples
CC derived from humans and animals. Specifically, it refers to using
CC intelligent primers to obtain an amplification product in order that the
CC molecular mass of the amplicon can be determined by mass spectroscopy,
CC which in turn identifies the pathogen found in the sample. The present
CC invention describes the rapid detection and identification of an
CC etiologic agent that does not require nucleic acid sequencing, and
CC instead relies on the use of intelligent primers to target ribosomal RNA
CC or housekeeping genes. Accordingly, this method can be used to identify a
CC pathogen or infectious agent in a biological sample, which is useful in
CC pharmacogenetic analysis and medical diagnosis (including cancer
CC diagnosis based on mutations and polymorphisms), or for detecting single
CC nucleotide polymorphisms in blood typing or stereotyping of viruses. This
CC oligonucleotide sequence is an intelligent PCR primer used to identify
CC different bacterial strains, given in an exemplification of the
CC invention.

 XX
 CC This invention relates to a novel activated mutant protein tyrosine
 CC kinases and associated methods for diagnosing cancer and screening for
 CC anti-cancer agents. Protein kinases are signalling molecules involved in
 CC tumorigenesis. Mutational analysis of the human tyrosine kinase gene
 CC family identified somatic alteration sin 1 in 5 colorectal cancers, with
 CC the majority of mutations occurring in the NTRK3, FES, GUCY2F and
 CC MCKK/MLK4 genes. Most were identified in the kinase domain. The invention
 CC may be useful for the production of compounds with a cytostatic activity
 CC acting as protein tyrosine kinase inhibitors or guanylate cyclase
 CC stimulators. The invention may be useful for developing methods for
 CC detecting mutations involved in cancer or screening for anti-cancer
 CC agents. The present sequence is that of a human-derived oligonucleotide
 CC which is related to the invention.

 PT comprises detecting single nucleotide polymorphism (SNP), in the
 PT individual's nucleic acids.
 PT
 XX Claim 19; SEQ ID NO 67973; 146pp; English.
 PS
 XX The invention relates to identifying an individual who has altered risk
 CC for developing coronary stenosis comprising detecting a single nucleotide
 CC polymorphism (SNP) in any one of the 67073 nucleotide sequences (not
 CC given in the specification), in the individual's nucleic acids, where the
 CC presence of the SNP is correlated with an altered risk for stenosis in
 CC the individual. Also included are an isolated nucleic acid molecule
 CC comprising at least 8 contiguous nucleotides where one of the
 CC nucleotides is an SNP as cited above, or their complement), an isolated
 CC polypeptide comprising an amino acid sequence selected from any of the
 CC 696 amino acid sequences (not defined in the specification), an antibody
 CC that specifically binds to the polypeptide (or its antigen-binding
 CC fragment), an amplified polynucleotide containing the SNP as cited (where
 CC the amplified polynucleotide is between about 16 and about 1,000
 CC nucleotides in length), an isolated polynucleotide which specifically
 CC hybridises to a nucleic acid molecule containing the SNP, a kit for
 CC detecting a SNP in a nucleic acid, detecting a SNP in a nucleic acid
 CC molecule, detecting a variant polypeptide and identifying an agent useful
 CC in therapeutically or prophylactically treating stenosis. The detection
 CC step of the method is carried out by a process selected from allele-
 CC specific probe hybridisation, allele-specific primer extension, allele-
 CC specific amplification, sequencing, 5' nuclease digestion, molecular
 CC beacon assay, oligonucleotide ligation assay, size analysis, and single-
 CC stranded conformation polymorphism. The method is useful for identifying
 CC an individual who has altered risk for developing coronary stenosis,
 CC which can lead to angina (ischaemic chest pain), myocardial infarction
 CC and ultimately sudden cardiac death. The present sequence is an allele
 CC specific primer for amplifying a SNP-containing region of a human marker
 CC gene associated with stenosis. NOTE: SEQ ID 1-67771 are not shown in the
 CC specification but are provided on a CD-R named CL001510CDR which was not
 CC supplied with the specification.

XX Polymorphic bovine DNA markers - used in genetic identification, gene
PT mapping, and selective breeding.
PS
XX Table 7; Page 231; 517pp; English.
XX
XX The sequence is that of a bovine microsatellite sequence obt'd. by
CC screening a library of bovine MboI DNA fragments of between 250 and 500
CC bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC clones cross-hybridised. Assuming independent distribution of
CC microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC in the bovine genome is estimated at >100, 000. The sequence information
CC for ca. 230 such bovine microsatellites is summarised in the
CC specification and indexed herein (see below). The sequences upstream and
CC downstream of the microsatellite sequence were used to generate the
CC required PCR primers for in vitro amplification of the corresp.
CC microsatellite (using the program OPTIPRIM). The microsatellites may be
CC used to identify individuals for parentage testing, and in the genetic
CC mapping of economic trait loci, or genes involved in the determination of
CC economically important traits esp. in cattle, to allow selective
CC breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

XX Claim 2; Page 18; 37pp; English.
XX
XX A claimed enzymatic RNA mol. for the cleavage of apolipoprotein (a)
CC (apo(a)) mRNA, specifically a hammerhead ribozyme, has binding arms
CC complementary to the present sequence (nucleotide position 11423). The
CC ribozyme blocks to some extent apo(a) expression, and can therefore be
CC used to diagnose or treat conditions related to lipoprotein (a) levels,
CC e.g. atherosclerosis, myocardial infarction, stroke, restenosis and heart
CC disease. PCR was used to generate a substrate for T7 RNA polymerase
CC transcription from human apo(a) cDNA clones. Labelled transcripts were
CC synthesised in vitro to form 2 templates. The oligonucleotides and
CC labelled transcripts were annealed, RNaseH added and the mixes.
CC incubated. After a designated time the reactions were stopped, and RNA
CC sepd. on sequencing polyacrylamide gels. The percentage of substrate
CC cleaved was determined by autoradiographic quantification, and the most
CC accessible ribozyme target sites chosen

XX PT Identifying nucleic acid ligands of a target molecule comprises annealing
XX PT complementary oligonucleotides, partitioning the nucleic acids and
XX PT amplifying the nucleic acids exhibiting increased affinity.
XX PS Example 2; Page 76; 264pp; English.
XX CC The invention relates to a method of identifying nucleic acid ligands of
XX CC a target molecule from a candidate mixture composed of single stranded
XX CC nucleic acids, each having a region of randomised sequence and a region
XX CC of fixed sequence. The method uses modified versions of the SLEX
XX CC (systematic evolution of ligands by exponential enrichment) method in
XX CC which the participation of fixed sequences is minimised or eliminated.
XX CC This method comprises annealing complementary oligonucleotides to the
XX CC fixed sequences of the candidate molecule mixture, contacting the
XX CC candidate mixture with the target molecule, partitioning the nucleic
XX CC acids which have increased affinity relative to the candidate mixture,
XX CC and amplifying the nucleic acids exhibiting increased affinity to yield a
XX CC ligand enriched mixture of nucleic acids. In one embodiment of the
XX CC invention, one or more regions of fixed sequences is replaced with
XX CC different fixed sequences, and the binding, partitioning and
XX CC amplification steps are repeated. In another embodiment, the partitioned
XX CC nucleic acids are hybridised with a library of single stranded
XX CC complementary nucleic acids, are then amplified, and the fixed regions of
XX CC the increased affinity nucleic acids cleaved. In the exemplifications of
XX CC the invention, a consensus binding site for MS2 CP (bacteriophage MS2
XX CC replicase fragment was identified by SLEX. MS2 CP binding sites were
XX CC then identified in the Escherichia coli genomic library by SLEX or by
XX CC the RNAMOT program. The present sequence represents an E. coli MS2 CP
XX CC binding site identified by the RNAMOT program

 DR Ribozymes having modified bases and methods for producing them - for use
 XX in inhibiting disease related genes.
 PT Claim 2; Page 200; 407pp; English.
 PS The present sequence represents a preferred target sequence for an
 XX enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the
 CC nucleotide base position indicated in the DE line. Regions of the mRNA
 CC that do not form secondary folding structures and that contain potential
 CC hammerhead and hairpin ribozyme cleavage sites were identified by
 CC computer analysis. Ribozymes directed against these mRNA sequences were
 CC designed and synthesised with modifications that improve their nuclease
 CC resistance. The ribozymes cleave the ICAM-1 target sequences and thereby
 CC inhibit ICAM-1 expression, making them useful for reducing transplant
 CC rejection and alleviating symptoms in patients with rheumatoid arthritis,
 CC asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to
 CC correct PI field.)

XX
XX Detecting clinically important bacteria, useful for diagnosis,
PT particularly in blood cultures, comprises hybridization to sequence- or
PT species-specific probes.
XX
XX Claim 1; SEQ ID NO 27; 90pp; German.
XX
XX This invention describes a novel method for detecting clinically relevant
CC bacteria which comprises hybridisation in which a target nucleic acid,
CC representing part of the genome of the bacteria or its complement, is
CC hybridised under stringent conditions to a sequence- and/or species-
CC specific probe, then the nucleic acid, or its hybridisation to the probe,
CC is detected. Either the probes are immobilized (particularly to a solid
CC phase through a linker, e.g. on a DNA chip) and the nucleic acid is
CC labelled, or the probe is labelled. The method is useful for diagnostic
CC detection of bacteria, particularly in blood cultures, including
CC differentiation between species. A typical self-amplifying chip supported
CC 12 pairs of immobilized primers, each pair specific for a particular
CC species of bacterium, at different locations. It was used to perform a
CC solid-phase PCR (15 minutes at 95degC, then 40 cycles of 15 seconds at
CC 95degC and 45 seconds at 58degC, in presence of Cy5-labelled
CC deoxycytosine triphosphate), then washed and fluorescence at each
CC location measured using a confocal laser scanner. ADN01408-ADN01573
CC represent probes used in the method of the invention.

XX DNA probes specific for mitochondrial DNA associated with type-T
PT cytoplasmic male sterility - for detecting male sterility in maize
PT plants.
XX
XX Claim 4; Col 23; 16pp; English.
XX
XX This DNA fragment is part of the TURF 2H3 region of Zea Mays. TURF 2H3
CC (3547 nucleotides long) is found in mitochondrial DNA, and is uniquely
CC arranged in maize affected by cytoplasm male sterility type T (cms-T).
CC The present sequence corresponds to positions 1400-1416 of TURF 2H3, and
CC is located in the middle of open reading frame 13. A synthetic
CC oligonucleotide whose sequence is complementary to the present sequence
CC has also been claimed. Both oligonucleotides can be used as probes to
CC identify a restriction fragment whose size in cms-T mitochondrial DNA is
CC different from the corresponding fragment in normal mitochondrial DNA.
CC They are useful for rapidly and specifically testing maize plants for T-
CC type cytoplasmic male sterility. (Updated on 25-MAR-2003 to correct PF
CC field.)

XX
XX Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
PT stability - useful for treating e.g. tumour angiogenesis, psoriasis,
PT rheumatoid arthritis, etc., in a human patient.
XX
XX Claim 4; Page 179; 218pp; English.
XX
XX The present invention describes nucleic acid molecules which modulate the
CC synthesis, expression and/or stability of a mRNA encoding 1 or more
CC receptors of vascular endothelial growth factor (VEGF). A patient
CC (preferably human) having a condition associated with the level of the
CC fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
CC receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
CC angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
CC treated by administering the nucleic acid molecule or the expression
CC vector to the patient. AAX67275 to AAX75752 represent specific examples
CC of nucleic acid molecules from the present invention

XX
XX Disclosure; SEQ ID NO 7448; 214pp; English.
XX
XX The present invention describes a human genome-derived myosin-like
CC protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
CC 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
CC nucleic acids can be used as probes to detect, characterize and quantify
CC hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
CC provide initial substrates for the recombinant engineering of hGDMPLP-1
CC protein variants having desired phenotypic improvements, and for
CC expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
CC used as immunogens to raise antibodies that specifically recognise hGDMPLP
CC -1 proteins, as standards in assays used to determine the concentration
CC and/or amount specifically of hGDMPLP proteins, as specific biomolecule
CC capture probes for surface-enhanced laser desorption/ionisation, as
CC therapeutic supplement in patients having specific deficiency in hGDMPLP-1
CC production, and in vaccines or for replacement therapy. The
CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
CC disorder associated with the expression of hGDMPLP-1, in particular heart
CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
CC The present sequence represents an oligomer used in the screening of the
CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO

XX New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins,
 FT or as specific biomolecule capture probes for surface-enhanced laser
 FT desorption/ionization, comprises human myosin-like protein hGDMLP-1.

XX

PS Disclosure; SEQ ID NO 8420; 214pp; English.
 XX The present invention describes a human genome-derived myosin-like
 CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
 CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1
 CC nucleic acids can be used as probes to detect, characterise and quantify
 CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to
 CC provide initial substrates for the recombinant engineering of hGDMLP-1
 CC protein variants having desired phenotypic improvements, and for
 CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
 CC used as immunogens to raise antibodies that specifically recognise hGDMLP
 CC -1 proteins, as standards in assays used to determine the concentration
 CC and/or amount specifically of hGDMLP proteins, as specific biomolecule
 CC capture probes for surface-enhanced laser desorption/ionisation, as
 CC therapeutic supplement in patients having specific deficiency in hGDMLP-1
 CC production, and in vaccines or for replacement therapy. The
 CC polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
 CC disorder associated with the expression of hGDMLP-1, in particular heart
 CC and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
 CC The present sequence represents an oligomer used in the screening of the
 CC hGDMLP-1 sequence in the exemplification of the present invention. N.B.
 CC The sequence data for this patent did not form part of the printed
 CC specification, but was obtained in electronic format directly from WIPO
 CC at ftp.wipo.int/pub/published_pct_sequence

PT creating plants with desired phenotypes, e.g. stress tolerance, improved
PT nutritional value, herbicide or disease resistance, or modified oil
PT production.
XX Claim 7; Page 101; 220pp; English.
XX The invention relates to an oligonucleotide for targeted alteration of a
CC genetic sequence, which comprises a single-stranded oligonucleotide
CC having a DNA domain. The DNA domain has at least one mismatch with
CC respect to the genetic sequence to be altered and further comprises
CC chemical modifications of the oligonucleotide. The chemical modifications
CC consist of o-methyl modification, an LNA modification, two or more
CC phosphorothioate linkages on a terminus, or a combination of any two or
CC more of these modifications. The oligonucleotides are useful for
CC directing repair or alteration of plant genetic information. The
CC oligonucleotides are particularly useful for creating plants with desired
CC phenotypes, e.g. environmental or abiotic stress tolerance, improved
CC nutritional value (e.g. altering amino acid content of plants or
CC conferring amino acid over production), herbicide resistance (e.g.
CC glyphosate resistance, imidazolinone and sulphonylurea herbicide
CC resistance, porphyrin herbicide resistance or triazine resistance),
CC disease resistance, modified oil production, modified starch production
CC (e.g. increased starch or production of waxy starch), altered floral
CC morphology (e.g. male-sterile plants) or modified fatty acid content
CC (e.g. reduced palmitate, increased stearate or reduced linolenic acid).
CC The oligonucleotides are also useful for producing albino mutants for the
CC analysis of photosynthetic processes. This sequence represents a genome
CC altering oligonucleotide of the invention

XX PT New nucleic acid molecule that modulates replication of West Nile Virus
XX (MNV), useful for treating a condition related to MNV infection e.g.
XX pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
XX
XX PS Claim 23; SEQ ID NO 10742; 495pp; English.
XX
XX CC The invention relates to nucleic acid molecules that modulate replication
XX of the West Nile Virus (MNV). The nucleic acid molecules are useful for
XX treating a condition related to MNV infection e.g. pancreatitis,
XX encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
XX liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid
XX molecule is selected from the group of ribozymes consisting of
XX Hammerhead, Inozyme, G-cleaver, DNazyme, Amberzyme and Zinzyme. The
XX nucleic acid molecules further comprise at least five ribose residues, at
XX least ten 2'-O-methyl modifications, phosphorothioate linkages on at
XX least three of the 5' terminal nucleotides and a 3' end modification of a
XX 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
XX are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
XX in the specification. The present sequence is that of a nucleic acid
XX molecule of the invention

XX with tumors and cell degeneration, also related polypeptides, antibodies
XX and transfected cells.
XX
XX PS Disclosure; Page 136; 720pp; French.
XX
XX CC The invention relates to a novel isolated 17 mer nucleic acid sequence,
XX given in the specification, a sequence containing at least 15 consecutive
XX nucleotides from the 17 mer sequence, a sequence with, after optimal
XX alignment, at least 80 % identity to the 17 mer sequence, a sequence that
XX hybridizes to them under highly stringent conditions, or the complement
XX of any of them, or the corresponding RNA. The novel isolated nucleic
XX acids of the invention are useful as probes and primers for detecting,
XX identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
XX component of a gene chip, in vitro as (anti)sense reagents, and for
XX production of recombinant polypeptides. Any of the nucleic acids,
XX polypeptides, vectors containing the nucleic acids, cells containing the
XX vector or antibodies directed against the polypeptides are useful for
XX preparation of pharmaceuticals for prevention and/or treatment of viral
XX diseases that are characterised by development of tumours or cell
XX degeneration, specifically cancer but also Alzheimer's disease and
XX schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
XX patient samples is useful for diagnosis and/or prognosis of these
XX diseases. The polypeptides can also be used to generate antibodies, and
XX both the polypeptide and antibodies are useful as components of protein
XX chips. The nucleic acid sequences of the invention can be used in gene
XX therapy. This polynucleotide sequence represents a tumour suppression
XX related human fukutin oligonucleotide of the invention

XX Novel enzymatic nucleic acid molecules which down regulates expression of
 PT a sequence encoding a subunit of nuclear factor kappa B useful for
 PT treating cancer, inflammatory disorders and autoimmune diseases.

XX Claim 3; Page 38; 72pp; English.

XX The invention describes an enzymatic nucleic acid molecule (I) which down
 CC regulates expression of a sequence encoding a subunit of nuclear factor
 CC kappa B (NFkB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme
 CC configuration. The enzymatic nucleic acid molecule is adapted to treat
 CC cancer and is useful for down-regulating REL-A activity in a cell, for
 CC treating a patient having a condition associated with the level of REL-A.
 CC (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in
 CC the presence of a divalent cation, especially Mg²⁺. The enzymatic and
 CC antisense nucleic acid molecules are useful for treating breast, lung,
 CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,
 CC cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or
 CC multidrug resistant cancer. The method involves use of other drug
 CC therapies such as monoclonal antibodies, REL-A-specific inhibitors or
 CC chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate,
 CC cyclophosphamide, doxorubicin, fluorouracil carboplatin, edatrexate,
 CC gemcitabine or radiation therapy. The enzymatic and antisense nucleic
 CC acid molecules are also useful for treating inflammatory disease such as
 CC rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,
 CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
 CC rejection, gene therapy applications, ischaemia/reperfusion injury
 CC (central nervous system (CNS) and myocardial), glomerulonephritis,
 CC sepsis, allergic airway inflammation, inflammatory bowel disease or
 CC infection. This sequence represents the substrate of a novel enzymatic
 CC nucleic acid molecule

Novel short interfering RNA and enzymatic nucleic acid useful for
treating cancer, modulates the expression of a nucleic acid encoding
HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
Claim 4; Page 138; 185pp; English.

The invention relates to a novel short interfering RNA (siRNA) nucleic
acid molecule or an enzymatic nucleic acid molecule, that modulates
expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras,
human immunodeficiency virus (HIV) or a component of HIV. The nucleic
acid molecule of the invention has cytostatic, anti-HIV, and anti-
rheumatic activity. The nucleic acid molecules are useful for reducing
HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are
also useful for treating breast, ovarian, colorectal, lung, prostate,
bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences

New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
Disclosure; Page 657; 771pp; French.
The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal expression of the nucleotides.

New prostate cancer candidate protein 1 (PCCP1), useful for preparing a composition for treating or preventing a disorder associated with decreased or increased expression or activity of PCCP1 e.g., tumor.
Example 2; SEQ ID NO 777; 164pp; English.
The invention relates to a novel isolated nucleic acid that encodes a protein with a chromatin organisation modifier (CHROMO) domain. The polynucleotide of the invention demonstrates cytostatic activity and may be useful for preparing a composition for treating or preventing a disorder associated with decreased or increased expression or activity of PCCP1 (prostate cancer candidate protein 1), such as a tumour, as well as during gene therapy and vaccine production procedures. The current sequence is that of the human PCCP1-related DNA fragment SEQ ID 4-directed probe of the invention. Note: The current sequence is not shown within the specification per se but was retrieved from the WipoWeb database.

XX New isolated nucleic acid, useful for treating viral diseases associated
PT with tumors and cell degeneration, also related polypeptides, antibodies
PT and transfected cells.
XX
XX Disclosure; SEQ ID NO 3896; 30pp; French.
XX
XX This invention relates to novel isolated nucleic acid sequences involved
CC in the phenomena of tumour suppression, tumour reversion, apoptosis
CC and/or resistance to viruses. The invention may be useful for the
CC development of compounds with a cytostatic, virucide, neuroprotective,
CC nontropic or neuroleptic activity. The DNA sequences may be useful as
CC probes and primers for detecting, identifying, quantifying and/or
CC amplifying nucleic acid, for example as one component of a gene chip, in
CC vitro as antisense reagents and for production of recombinant
CC polypeptides. The invention may therefore be useful for preparation of
CC pharmaceuticals for prevention and/or treatment of viral diseases that
CC are characterised by development of tumours or cell degeneration,
CC specifically cancer but also Alzheimer's disease and schizophrenia. The
CC present sequence is that of a nucleic acid sequence of the invention.
CC Note: The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO

XX
XX Novel enzymatic nucleic acid that down-regulates expression of neurite
PT growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
PT protein kinase PKR genes, for treating cancer and inflammatory disease.
XX
XX Claim 161; SEQ ID NO 5229; 317pp; English.
XX
XX The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC IkappaB kinase (IKK) or protein kinase PKR. The nucleic acids of the
CC invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC nucleic acids of the invention are also useful for down-regulating the
CC expression of a target gene and as a diagnostic tool to examine genetic
CC drifts and mutations within diseased cells or to detect the presence of a
CC target RNA in a cell. The present RNA sequence represents a human PKR
CC substrate sequence.

XX Identifying a cell with a desired oligonucleotide-directed sequence
PT alteration at a nucleic acid target site within the cell by identifying
PT the desired sequence alteration in cells selected for the presence of a
PT selectable phenotype.

XX Example 25; SEQ ID NO 976; 303pp; English.

XX This invention relates to a novel method of identifying a cell having a
CC desired oligonucleotide-directed sequence alteration at a first nucleic
CC acid target site within the cell. The method comprises identifying the
CC desired sequence alteration in cells that have been selected for the
CC presence of a selectable phenotype conferred by a concurrent
CC oligonucleotide-directed sequence alteration at a second nucleic acid
CC target site within the cells. The method is useful in identifying a cell
CC having a desired oligonucleotide-directed sequence alteration at a first
CC nucleic acid target site within the cell. The method may be useful for
CC the production of plants with herbicide resistance, male or female
CC sterile plants, abiotic stress tolerance, albino plants or plants with
CC altered amino acid production as well as for use in mammalian cell lines.
CC The present sequence is that of a mutagenic oligonucleotide which was
CC used in the exemplification of the invention.

 PS
 XX The invention relates to a novel polypeptide (I) comprising a sequence
 CC (S1) of myosin-like protein-1 (hGDMPLP-1) having 2568 amino acids fully
 CC defined in the specification, a fragment of at least 8 amino acids of
 CC (S1), 95% deviation from (S1) which are conservative substitutions, and
 CC 65% identity to (S1). A polypeptide of the invention acts as an agonist or
 CC antagonist of hGDMPLP-1, or as an inhibitor of hGDMPLP-1 activity. A
 CC pharmaceutical composition of the invention is useful for treating or
 CC preventing a disorder associated with decreased expression or activity of
 CC hGDMPLP-1, such as a disorder of heart and/or skeletal muscle function.
 CC The present sequence represents a 17-mer nucleotide, used in the
 CC invention for scanning the sequence represented in ACN63103

 PT Novel enzymatic nucleic acid that down-regulates expression of neurite
 PT growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
 PT protein kinase PKR genes, for treating cancer and inflammatory disease.
 XX
 PS Claim 59; SEQ ID NO 4354; 317pp; English.
 XX
 CC The invention comprises nucleic acids (e.g. antisense oligonucleotides)
 CC that down regulate the expression or inhibit the function of a receptor
 CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
 CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
 CC invention are useful for treating: cerebrovascular accident, central
 CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
 CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
 CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
 CC disease, lupus, multiple sclerosis, transplant/graft rejection,
 CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
 CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
 CC nucleic acids of the invention are also useful for down-regulating the
 CC expression of a target gene and as a diagnostic tool to examine genetic
 CC drifts and mutations within diseased cells or to detect the presence of a
 CC target RNA in a cell. The present RNA sequence represents a human PKR
 CC substrate sequence.

PT	Novel enzymatic nucleic acid that down-regulates expression of neurite				
PT	growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or				
PT	protein kinase PKR genes, for treating cancer and inflammatory disease.				
XX					
PS	Claim 59; SEQ ID NO 4385; 317pp; English.				
XX					
CC	The invention comprises nucleic acids (e.g. antisense oligonucleotides)				
CC	that down regulate the expression or inhibit the function of a receptor				
CC	for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),				
CC	IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the				
CC	invention are useful for treating: cerebrovascular accident, central				
CC	nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,				
CC	lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,				
CC	restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune				
CC	disease, lupus, multiple sclerosis, transplant/graft rejection,				
CC	ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic				
CC	conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The				
CC	nucleic acids of the invention are also useful for down-regulating the				
CC	expression of a target gene and as a diagnostic tool to examine genetic				
CC	drifts and mutations within diseased cells or to detect the presence of a				
CC	target RNA in a cell. The present RNA sequence represents a human PKR				
CC	substrate sequence.

 PS
 XX Claim 15; Page 19; 52pp; English.
 XX
 CC The sequence represents an allele specific oligonucleotide probe for
 CC genotyping individuals using the Human gene encoding the m1 muscarinic
 CC acetylcholine receptor, CHMR1. CHMR1 is one subtype of a family of 5
 CC genetically distinct muscarinic acetylcholine receptors, mAChR, that play
 CC important roles in higher brain function such as learning and memory. The
 CC protein is a possible drug target for treatments for Alzheimer's disease
 CC and dementia with Lewy bodies (DLB). The gene, polypeptide, haplotypes
 CC and antibodies raised against the protein are useful for diagnosing and
 CC developing treatments for diseases associated with the abnormal
 CC expression of the gene or activity of the protein, e.g. Alzheimer's
 CC disease and dementia with Lewy bodies

XX
CC The present invention relates to a method for ameliorating the effects of
CC skin disorders. The method comprises contacting the skin with an
CC antisenesc oligonucleotide, (for Insulin-like Growth Factor [IGF]-1
CC receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of
CC inhibiting or reducing growth factor mediated cell proliferation,
CC inflammation and/or other disorders. The present sequence is an
CC oligonucleotide which can be used to design the antisenesc
CC oligonucleotides of the present invention (see AAF45151 and AAF45153-
CC F45161). The method is useful for ameliorating the effects of psoriasis,
CC ichthyosis, pityriasis, ruba, pilaris, serborrhea, keloids, keratosis,
CC neoplasias, scleroderma, warts, benign growths, cancers of the skin, a
CC hyperneovascular condition such as a neovascular condition of the retina,
CC brain or skin, growth factor-mediated malignancies, other sclerotic
CC disease, kidney disease, hyperproliferation of the inside of blood
CC vessels or any other hyperplasia

PT immunodeficiency virus infection and inflammatory diseases.
XX
XX Claim 16; Page 13; 81pp; English.
XX

The invention relates to single nucleotide polymorphisms in the gene encoding human intercellular adhesion molecule 2 (ICAM2). A method for haplotyping the ICAM2 gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the ICAM2 haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pairs can be assigned to specific genotypes. An association between a trait and a haplotype or haplotype pair of the ICAM2 gene can be identified by comparing the frequency of the haplotype or haplotype pair in a population exhibiting the trait with the frequency of the haplotype or haplotype pair in a reference population, where a higher haplotype frequency in the trait population indicates the trait is associated with the haplotype or haplotype pair. ICAM2 and its corresponding DNA are used for studying the expression and function of ICAM2, for use in screening for candidate drugs to treat diseases related to ICAM2 activity, such as HIV infection and inflammatory diseases. The sequences are also useful for studying the effect of variation on the biological activity of ICAM2 as well as on the binding affinity of candidate drugs targeting ICAM2. Sequences AAS95362-AAS95417 and AAS95419-AAS95442 represent allele-specific oligonucleotide probes, sequencing primers, PCR primers and cDNA encoding human ICAM2

XX
XX New polynucleotide containing polymorphisms in the human sodium channel
PT voltage gated type 2 beta polypeptide (SCN2B) gene, for developing drugs
PT for treating demyelinating diseases.
XX
XX Claim 15; Page 13; 63pp; English.
XX
XX This invention relates to an isolated polynucleotide which is a
CC polymorphic variant of a reference sequence for sodium channel voltage
CC gated type 2 beta polypeptide (SCN2B) gene. The methods have
CC applicability in developing diagnostic tests and therapeutic treatments
CC

CC for demyelinating diseases. The protein is useful for studying the
 CC expression and function of SCN2B and expressing SCN2B protein for use in
 CC screening for candidate drugs to treat diseases related to SCN2B
 CC activity. The polymorphism and haplotype data are useful for validating
 CC whether SCN2B is a suitable target for drugs to treat demyelinating
 CC diseases, screening for such drugs and reducing bias in clinical trials.
 CC The haplotyping method is useful to validate SCN2B as a candidate target
 CC for treating a specific condition or disease predicted to be associated
 CC with SCN2B activity. A recombinant non-human organism transformed or
 CC transfected with the polypeptide is useful for studying expression of the
 CC SCN2B isogenes in vivo, for in vivo screening and testing of drugs
 CC against SCN2B protein and for testing the efficacy of therapeutic agents
 CC and compounds for demyelinating diseases in a biological system. This
 CC sequence is used during the detection of polymorphisms of the SCN2B gene

 XX
 CC The present invention relates to polymorphisms and haplotypes of the
 CC human beta2-adrenergic receptor (beta2-AR) gene located on chromosome
 CC 5q31-32, and methods for haplotyping and/or genotyping the beta2AR gene
 CC in an individual. The methods of the invention make use of allele-
 CC specific oligonucleotides (ASOs) as probes and primers for detecting the
 CC beta2AR gene polymorphisms. The beta2AR gene polymorphisms are useful in

CC studying the expression and biological function of beta2AR, and for
 CC developing drugs targeting this receptor. They are also useful for
 CC therapeutic purposes such as treating disorders affected by expression or
 CC function of beta2AR such as congestive heart failure, arrhythmia,
 CC ischaemic heart disease, hypertension, migraine, asthma, chronic
 CC obstructive pulmonary disease (COPD), obesity, diabetes and premature
 CC labour. The method is useful for determining the frequency of a beta2AR
 CC genotype or haplotype in a population. AAS18449-AAS18456 represent ASO
 CC forward primers for detecting human beta2AR gene polymorphisms

 PT New calmodulin-1 (CALM-1) isogene polymorphic variants, useful in
 PT expressing CALM1 protein for use in screening for candidate drugs to
 PT treat diseases related to CALM1 activity such as Alzheimer's disease.
 XX
 PS Claim 15; Page 13; 82pp; English.
 XX
 CC The invention relates to an isolated polynucleotide comprising a sequence
 CC selected from a polymorphic variant of calmodulin 1 (CALM1). The
 CC polymorphic variant comprises a CALM1 isogene defined by a haplotype
 CC selected from haplotypes 1-21 given in the specification. The
 CC polymorphisms are useful for studying the biological function of CALM1 as
 CC well as in identifying drugs targeting this protein for the treatment of
 CC a disorder related to its abnormal expression or function. The
 CC polymorphic variants may also be used in screening for compounds
 CC targeting CALM1 to treat a specific condition or disease predicted to be
 CC associated with CALM1 activity. Establishing CALM1 haplotype or haplotype
 CC pair of an individual is useful for improving the efficiency and
 CC reliability of several steps in the discovery and development of drugs
 CC for treating diseases associated with SCYA3 activity, e.g. Alzheimer's
 CC disease and diseases involving defects in calcium-dependent signal
 CC transduction. Haplotyping the CALM1 gene in an individual is also useful
 CC in the design of clinical trials of candidate drugs for treating a

CC specific condition or disease predicted to be associated with CALM1
 CC activity. AAS95892-AAS96018 represent human CALM1 allele- specific
 CC oligonucleotides and PCR primers of the invention

 PT New calmodulin-1 (CALM-1) isogene polymorphic variants, useful in
 PT expressing CALM1 protein for use in screening for candidate drugs to
 PT treat diseases related to CALM1 activity such as Alzheimer's disease.
 XX
 PS Claim 15; Page 13; 82pp; English.
 CC The invention relates to an isolated polynucleotide comprising a sequence
 CC selected from a polymorphic variant of calmodulin 1 (CALM1). The
 CC polymorphic variant comprises an CALM1 isogene defined by a haplotype
 CC selected from haplotypes 1-21 given in the specification. The
 CC polymorphisms are useful for studying the biological function of CALM1 as
 CC well as in identifying drugs targeting this protein for the treatment of
 CC a disorder related to its abnormal expression or function. The
 CC polymorphic variants may also be used in screening for compounds
 CC targeting CALM1 to treat a specific condition or disease predicted to be
 CC associated with CALM1 activity. Establishing CALM1 haplotype or haplotype
 CC pair of an individual is useful for improving the efficiency and
 CC reliability of several steps in the discovery and development of drugs
 CC for treating diseases associated with SCYA3 activity, e.g. Alzheimer's
 CC disease and diseases involving defects in calcium-dependent signal
 CC transduction. Haplotyping the CALM1 gene in an individual is also useful
 CC in the design of clinical trials of candidate drugs for treating a
 CC specific condition or disease predicted to be associated with CALM1
 CC activity. AAS95892-AAS96018 represent human CALM1 allele- specific
 CC oligonucleotides and PCR primers of the invention

 PT New enzymatic nucleic acid molecules - cleave RNA produced by e.g. c-myb,
 PT for treating restenosis or cancer.
 XX
 PS Claim 1; Page 64; 128pp; English.
 CC The present sequence represents the preferred target sequence for an
 CC enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves
 CC the human c-myb sequence at the base position indicated in the descriptor
 CC line. The c-myb sequence was screened for optimal ribozyme target sites
 CC using a computer folding algorithm, and regions of the mRNA which did not
 CC form secondary folding structures and contained potential ribozyme
 CC cleavage sites were identified. Ribozymes were synthesised and their
 CC activities optimised by either varying the length of the binding arms or
 CC by modification to prevent degradation by nucleases. The ribozymes cleave
 CC the c-myb sequence and can be used to prevent smooth muscle cell
 CC hyperproliferation in restenosis, especially after coronary angioplasty,
 CC and in cancers

 PT New nucleic acids that interact, and optionally cleave, target sequences,
 PT used to treat cancer.
 XX
 PS Claim 77; Page 62; 148pp; English.
 XX
 CC The present invention describes nucleic acids (A) that interact stably
 CC with a target sequence and contain at least one phosphorodithioate
 CC link, having endonuclease activity. (A), and more generally any catalytic
 CC nucleic acid (A') that modulates expression of the oestrogen receptor
 CC gene, are used to treat cancer (particularly of breast or endometrium),
 CC in vivo or by transforming cells ex vivo and implanting treated cells, or
 CC for other conditions associated with levels of oestrogen receptor.
 CC Because of the high selectivity for targeted RNA, (A) can also be used to
 CC correlate inhibition of gene expression with alterations in phenotype,
 CC particularly for identification of therapeutic targets, and as research
 CC reagents (for RNA, in the same way that restriction endonucleases are
 CC used with DNA). The combination of modifications in (A) improves
 CC resistance to nucleases, binding affinity and/or activity. AAA23503 to
 CC AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
 CC AAA24748 to AAA25992 represent their corresponding target sequences.
 CC AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme

CC sequences, and AAA26107 to AAA26218 represent their corresponding target
 CC sequences. AAA26219 to AAA26271 represent other ribozyme sequences and

 XX
 PS Disclosure; SEQ ID NO 8974; 214pp; English.
 XX
 CC The present invention describes a human genome-derived myosin-like
 CC protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
 CC 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
 CC nucleic acids can be used as probes to detect, characterise and quantify
 CC hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
 CC provide initial substrates for the recombinant engineering of hGDMPLP-1
 CC protein variants having desired phenotypic improvements, and for

CC expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
 CC used as immunogens to raise antibodies that specifically recognise hGDMPLP
 CC -1 proteins, as standards in assays used to determine the concentration
 CC and/or amount specifically of hGDMPLP proteins, as specific biomolecule
 CC capture probes for surface-enhanced laser desorption/ionisation, as
 CC therapeutic supplement in patients having specific deficiency in hGDMPLP-1
 CC production, and in vaccines or for replacement therapy. The
 CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
 CC disorder associated with the expression of hGDMPLP-1, in particular heart
 CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
 CC The present sequence represents an oligomer used in the screening of the
 CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
 CC The sequence data for this patent did not form part of the printed
 CC specification, but was obtained in electronic format directly from WIPO

XX
XX Novel enzymatic nucleic acid molecules which down regulates expression of
PT a sequence encoding a subunit of nuclear factor kappa B useful for
PT treating cancer, inflammatory disorders and autoimmune diseases.
XX
XX Claim 3; Page 38; 72pp; English.
XX
XX The invention describes an enzymatic nucleic acid molecule (I) which down
XX regulates expression of a sequence encoding a subunit of nuclear factor
XX kappa B (NFkB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme
XX configuration. The enzymatic nucleic acid molecule is adapted to treat
XX cancer and is useful for down-regulating REL-A activity in a cell, for
XX treating a patient having a condition associated with the level of REL-A.
XX (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in
XX the presence of a divalent cation, especially Mg2+. The enzymatic and
XX antisense nucleic acid molecules are useful for treating breast, lung,
XX prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,
XX cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or
XX multidrug resistant cancer. The method involves use of other drug
XX therapies such as monoclonal antibodies, REL-A-specific inhibitors or
XX chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate,
XX cyclophosphamide, doxorubicin, fluorouracil carboplatin, edatrexate,
XX gemcitabine or radiation therapy. The enzymatic and antisense nucleic
XX acid molecules are also useful for treating inflammatory disease such as
XX rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,
XX obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
XX rejection, gene therapy applications, ischaemia/reperfusion injury
XX (central nervous system (CNS) and myocardial), glomerulonephritis,
XX sepsis, allergic airway inflammation, inflammatory bowel disease or

XX
XX Claim 1; Page 262; 387pp; English.
XX
XX The present invention relates to nucleic acid molecules which modulate
XX the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
XX Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
XX and enzymatic nucleic acids such as hammerhead ribozymes, DNazymes,
XX inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
XX are nucleic acid decoy molecules and aptamers that bind to HBV reverse
XX transcriptase and/or HBV reverse transcriptase primer sequences, as well
XX as oligonucleotides that specifically bind the Enhancer I region of HBV
XX DNA. The nucleic acids may be used to modulate the expression of HBV
XX genes and HBV viral replication. Also disclosed is a method for screening
XX compounds and/or potential therapies directed against HBV, and compounds
XX that modulate the expression and/or replication of HCV. The compounds and
XX methods of the invention are useful for the treatment of degenerative and
XX disease states related to HBV and HCV infection, replication and gene
XX expression such as cirrhosis, liver failure, and hepatocellular
XX carcinoma. The present sequence represents a substrate for one of the HCV
XX DNazyme or minus strand DNazyme sequences disclosed in the present
XX invention

 XX
 XX Novel compound useful for treating cirrhosis, liver failure,
 PT hepatocellular carcinoma, or condition associated with hepatitis C virus
 PT infection.
 XX
 XX Claim 1; Page 287; 387pp; English.
 XX
 XX The present invention relates to nucleic acid molecules which modulate
 CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
 CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
 CC and enzymatic nucleic acids such as hammerhead ribozymes, DNAsymes,
 CC inozymes, zinzymes, anberzymes, and G-cleaver ribozymes. Also disclosed
 CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse
 CC transcriptase and/or HBV reverse transcriptase primer sequences, as well
 CC as oligonucleotides that specifically bind the Enhancer I region of HBV
 CC DNA. The nucleic acids may be used to modulate the expression of HBV
 CC genes and HBV viral replication. Also disclosed is a method for screening
 CC compounds and/or potential therapies directed against HBV, and compounds
 CC that modulate the expression and/or replication of HCV. The compounds and
 CC methods of the invention are useful for the treatment of degenerative and
 CC disease states related to HBV and HCV infection, replication and gene
 CC expression such as cirrhosis, liver failure, and hepatocellular
 CC carcinoma. The present sequence represents a substrate for one of the HCV
 CC DNzyme or minus strand DNzyme sequences disclosed in the present
 CC invention

 XX
 XX Novel enzymatic nucleic acid that down-regulates expression of neurite
 PT growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
 PT protein kinase PKR genes, for treating cancer and inflammatory disease.
 XX
 XX Claim 59; SEQ ID NO 2090; 317pp; English.
 XX
 XX The invention comprises nucleic acids (e.g. antisense oligonucleotides)
 CC that down regulate the expression or inhibit the function of a receptor
 CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
 CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
 CC invention are useful for treating: cerebrovascular accident, central
 CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
 CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
 CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
 CC disease, lupus, multiple sclerosis, transplant/graft rejection,
 CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
 CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
 CC nucleic acids of the invention are also useful for down-regulating the
 CC expression of a target gene and as a diagnostic tool to examine genetic
 CC drifts and mutations within diseased cells or to detect the presence of a
 CC target RNA in a cell. The present RNA sequence represents a human IKK-
 CC gamma substrate sequence.

 CC This sequence represents a probe for hepatitis b virus (HBV), used in the
 CC method of the invention for detection and/or genetic analysis of
 CC hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally
 CC releasing, isolating or concentrating polynucleic acids (I) in the
 CC sample, and amplifying the relevant part of a suitable HBV gene in the
 CC sample with at least 1 suitable primer pair; (b) hybridising (I) with a
 CC combination of at least 2 nucleotide probes, which are applied to known
 CC locations on a solid support and hybridise specifically to mutant target
 CC sequences chosen from the HBV RT pol gene region, HBV preCore region,
 CC HBsAg region and/or HBV genotype specific target sequences, or their
 CC complements or U for T homologues; (c) detecting the hybrids formed in
 CC step (b), and inferring the HBV genotype and/or mutants present in the
 CC sample from the differential hybridisation signal(s). The composition can
 CC be used to diagnose and/or monitor HBV mutations and/or genotypes in a
 CC sample, specifically genotype, preCore mutations, vaccine escape
 CC mutations and RT gene mutations selected by treatment with drugs, e.g.
 CC lamivudine and penciclovir. (Updated on 27-AUG-2003 to correct OS field.)

XX This invention describes a novel reagent for the detection of
 CC polymorphism in the apolipoprotein (Apo) E gene and alpha-1
 CC antichymotrypsin (ACT) gene. The method involves primers specific to ApoE
 CC gene, primers specific to the ACT gene, detection probes for detecting
 CC ApoE gene polymorphisms and detection probes for detecting ACT gene
 CC polymorphisms. The method of the invention can be used in the diagnosis
 CC of Alzheimer's disease in which the combination between the gene
 CC polymorphism of ApoE gene and the gene polymorphism of ACT gene detected
 CC by the described detection method is connected to the contraction of
 CC Alzheimer's disease. The method is used for the estimation of the level of
 CC Alzheimer's disease in the population. The reagent can amplify the two
 CC genes simultaneously and detect the gene polymorphism of the two genes in
 CC one step. AAX82822-X82831 represent PCR primers and probes used to
 CC illustrate the method of the invention

XX Diagnosing sensitivity to a medicine for osteoporosis involves analyzing
 CC genetic polymorphisms of vitamin D receptor gene, estrogen receptor gene
 CC and apolipoprotein E gene.
 XX
 PS Claim 22; Page 44; 5ipp; English.
 XX
 CC The present invention relates to a method for anticipating the
 CC sensitivity to a medicine for osteoporosis. The method involves analysing
 CC combinations of genetic polymorphisms of a vitamin D receptor gene (VDR),
 CC an oestrogen receptor (ER) gene, and an apolipoprotein E (ApoE) gene from
 CC a human genome DNA sample. PCR primers AAC83918-C83926 and AAC83937-
 CC C83942 were used in the method of the present invention to amplify the
 CC VDR, ER and ApoE genes, and detection probes AAC83927-C83936 were used
 CC for detecting VDR, ER and ApoE genetic polymorphism. By relating a
 CC combination of the genetic polymorphisms detected using the detection
 CC probes described in AAC83927-C83936, a remedy for a bone-associated
 CC disease can be selected

 DR
 XX Preparing alphaviral vectors with mutations in a selected gene, for use
 XX as vaccines, particularly against pathogens that mutate rapidly,
 PT comprises replicating in the presence of a nucleoside analog.
 PT
 XX Example 3; Page 59; 103pp; English.
 PS
 XX The present invention relates to a method for preparing viral vectors
 XX which comprises inserting a gene of interest into an alphaviral vector
 CC such as pCytts, pSInkps and replicating the vector in the presence of
 CC alphaviral replicase and nucleoside analogues (5'-azacytidine (AZT), FU-
 CC 5'-fluorouridine) to produce a modified gene of interest. The replication
 CC is repeated until the modified gene in 90 % of the vector population
 CC contain a mutation in the modified gene which is 90-99 % identical with
 CC the gene of interest. The vector populations are used in vaccines for
 CC treatment or prevention of a wide variety of infectious diseases (viral
 CC or parasitic, e.g. human immuno deficiency virus (HIV), influenza,
 CC Trypanosoma or Plasmodium) and cancers such as liver carcinoma, stomach
 CC carcinoma, skin carcinoma and ovarian tumours. Vaccines containing the
 CC mutant populations will therefore be effective against viral escape
 CC mutants. Mutagenesis in a eukaryotic cell ensures that expressed proteins
 CC are correctly glycosylated. Antisera raised against the vaccines can be
 CC used for passive immunisation. The present sequence is Epo-3' RT (reverse
 CC transcription) PCR primer used for amplifying erythropoietin DNA from
 CC Sindbis virus which is an alphavirus. Erythropoietin is the gene of
 CC interest

XX Isolated nucleic acid molecules having polymorphisms in known human genes
XX e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers
XX for locating, identifying and characterizing the genes responsible for
XX disorder-related traits.
XX Example 23; Page 146; 714pp; English.
XX This invention relates to the sequence of an isolated nucleic acid
XX molecule comprising at least one base variation from that of a known
XX human cytochrome P450 A1 (CYP450A1), cytochrome P450 A2 (CYP450A2),
XX cytochrome P450 02B1 (CYP45002B1), adrenergic receptor beta1 (ADRB1),
XX aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator
XX (ARNT), cathepsin S (CTSS), cyclooxygenase 2 (COX2), diazepam binding
XX inhibitor (DBI), epoxide hydrolase 2 (EPHX2), 5-lipoxygenase activating
XX protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl
XX transferase (HNMT), kallikrein 2) KHK2, nicotinamide -N-methyl
XX transferase (NNMT), NADPH quinone oxidoreductase 2 (NQO2),
XX sulfoltransferase thermolabile (STM), UDP-glucuronosyl transferase 2B4
XX (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl
XX transferase (UGT2B15), urokinase receptor (uPA), multidrug resistance 1
XX (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3
XX (MRP3), orphan nuclear receptor (NRI12), or acetylcholine muscarinic
XX receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence.
XX The polymorphisms in the human genes cited in the invention are useful as
XX genetic linkage markers for locating and characterising the genes that
XX are responsible for specific traits within the genome and eventually
XX identifying the genes responsible for a variety of disorder-related
XX traits as a result of their e.g., overexpression, constitutive
XX expression, mutation or underexpression, which may be used in diagnosing
XX and/or treating the disorders. The nucleic acid molecules comprising the
XX polymorphic sequences contained in CYP450A1, CYP450A2, CYP4502B1,
XX ARNT, EPHX2, GST12, NNMT, NQO2, NRI12, STM, UGT2B4, UGT2B7, UGT2B15, AHR,
XX MDR1 and/or MDR3 are useful for screening individuals for altered drug
XX metabolism. The polymorphic sequences contained in CYP450A1, CYP450A2,
XX AHR, MDR1 and/or MDR3 may also be used to screen individuals for
XX susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are
XX used to screen for altered cardiovascular function, in COX2 for altered
XX susceptibility to colorectal tumours, in DBI or CHMR1 for altered central
XX nervous system function, in FLAP and HNMT for altered pulmonary,
XX immunological or haematological function, in KHK2 for altered serine
XX protease activity in the prostate, in LTF for altered immunological or
XX haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and
XX peripheral nervous system function. The present sequence represents a PCR
XX primer used to amplify the sequences of the invention

XX PT Novel isolated nucleic acid molecule comprising single nucleotide

XX PT polymorphism associated with fish, useful for forming PCR primers which

are used for detecting single nucleotide polymorphisms in fish nucleic acids.

Claim 18; SEQ ID NO 1137; 233pp; English.

The present invention describes an isolated nucleic acid (I) comprising a single nucleotide polymorphism (SNP) chosen from: (i) a nucleic acid of Salmo salar SNPs, Oreochromis niloticus SNPs or Atlantic halibut SNPs; and (ii) a nucleic acid having nucleotide sequence that hybridises to (i), or its complement under highly stringent hybridisation conditions. Also described: (i) an isolated oligonucleotide (II) comprising at least 17 contiguous nucleotides of a nucleotide sequence of S. salar SNPs, O. niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod polymorphic sites and seabass polymorphic sites, or their complement; (2) a primer pair (III) suitable for use in PCR, comprising two (II) capable of amplifying a nucleotide sequence chosen from S. salar SNPs and, O. niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod polymorphic sites and seabass polymorphic sites; and determining (M1) the origin of fish sample comprising providing a parentage genotype database comprising a collection of candidate parent genotypes, where each of the candidate parent genotype represents a distinct origin, and comparing a sample genotype to the parentage genotype database, where a match between the sample genotype and one of the candidate parent genotype identifies to the origin of the sample. (M1) is useful for determining the origin of a fish sample such as family salmonidae, S. salar, Tilapia, O. niloticus, rainbow trout, halibut, seabass and Atlantic cod. (II) is useful for detecting nucleic acid molecule comprising SNP in a sample, which involves contacting the sample containing nucleic acids with one or more (II) derived from nucleotide sequence of S. salar SNPs and O. niloticus SNPs, and identifying nucleic acid that hybridises to (II). (II) is useful for detecting nucleic acid molecule comprising a polymorphic sequence in a sample, comprising contacting the sample containing nucleic acids with one or more (II) which is derived from O. niloticus microsatellite, O. niloticus SNPs, Atlantic halibut SNPs, cod polymorphic sites or seabass polymorphic sites, and identifying a nucleic acid that hybridises to (II). (III) is useful for detecting nucleic acid molecule comprising a microsatellite sequence in sample. The present sequence is used in the exemplification of the present invention.

XX Identifying Sequence Tags from trapped genes, useful for diagnostic
PT applications, comprises using a gene-trap vector having a splice donor, a
PT type IIS restriction endonuclease cleavage site and a splice donor or
PT polyadenylation site.
XX Example 3; Page 25; 51pp; English.
XX The specification describes a method of identifying sequence tags from
XX trapped genes. The method comprises using a gene-trap vector that has a
CC splice donor, a type IIS restriction endonuclease cleavage site and a
CC splice donor or a polyadenylation site. mRNA is prepared from cells
CC stably transfected with the gene-trap vector; first and second cDNA
CC strands are synthesised from the mRNA; the cDNA strands are digested with
CC restriction endonucleases including the type IIS restriction
CC endonucleases to produce assay tags, where each assay tag comprises a
CC sequence Tag and a portion of the gene-trap vector; the assay tags are
CC concatenated, and the concatamers are amplified and sequenced to identify
CC the sequence of the assay tags and the sequence tags. The method is
CC useful for high throughput sequence tag identification based on
CC modifications of the serial analysis of gene expression technology, which
CC may be used in diagnosing or in finding cures for various pathological
CC conditions. The present sequence represents a sequence tag, identified
CC using the method of the invention

XX Identifying genes expressed during differentiation of a cell, useful,
PT e.g. in research into mechanisms leading to differentiation of stem
PT cells, comprises integrating a cell lineage targeting vector into the
PT genome of a host cell.

XX Example 5; SEQ ID NO 8; 45pp; English.
XX The present invention relates to a method (M1) for identifying genes
XX expressed during cell differentiation. The method is useful in research
CC into the mechanisms that lead to differentiation of stem cells. Knowledge
CC of these mechanisms is important in understanding embryonic development
CC and homeostasis within somatic tissues, and is also relevant to the
CC therapeutic use of stem cells. The method comprises: integrating into a
CC site in a host cell genome, a cell lineage targeting vector comprising a
CC pair of recombinase recognition sites flanking one or more
CC polyadenylation sites, a first selectable marker placed downstream or
CC between the two recombinase recognition sites, a reporter gene placed
CC downstream of the recombinase recognition sites, and a cell lineage
CC specific gene promoter placed upstream of the recombinase recognition
CC sites or a cell specific lineage gene placed downstream of the
CC recombinase recognition sites; amplifying cells generated from the host
CC cell; integrating into the genome of a plurality of the amplified cells,
CC a gene-trap vector comprising a splice acceptor, a type IIS restriction
CC endonuclease cleavage site, one or more polyadenylation sites, a second
CC selectable marker and a splice donor; allowing the cells to differentiate
CC; isolating cells in which the reporter gene is expressed indicating
CC expression of the cell lineage specific gene; and identifying trapped
CC genes in the isolated cells. The present sequence was used to illustrate
XX the invention.

XX Identifying genes expressed during differentiation of a cell, useful,
PT e.g. in research into mechanisms leading to differentiation of stem
PT cells, comprises integrating a cell lineage targeting vector into the
PT genome of a host cell.
XX Example 5; SEQ ID NO 9; 45pp; English.
XX

CC The present invention relates to a method (M1) for identifying genes
 CC expressed during cell differentiation. The method is useful in research
 CC into the mechanisms that lead to differentiation of stem cells. Knowledge
 CC of these mechanisms is important in understanding embryonic development
 CC and homeostasis within somatic tissues, and is also relevant to the
 CC therapeutic use of stem cells. The method comprises: integrating into a
 CC site in a host cell genome, a cell lineage targeting vector comprising a
 CC pair of recombinase recognition sites flanking one or more
 CC polyadenylation sites, a first selectable marker placed downstream or
 CC between the two recombinase recognition sites, a reporter gene placed
 CC downstream of the recombinase recognition sites, and a cell lineage
 CC specific gene promoter placed upstream of the recombinase recognition
 CC sites or a cell specific lineage gene placed downstream of the
 CC recombinase recognition sites; amplifying cells generated from the host
 CC cell; integrating into the genome of a plurality of the amplified cells,
 CC a gene-trap vector comprising a splice acceptor, a type IIS restriction
 CC endonuclease cleavage site, one or more polyadenylation sites, a second
 CC selectable marker and a splice donor; allowing the cells to differentiate
 CC; isolating cells in which the reporter gene is expressed indicating
 CC expression of the cell lineage specific gene; and identifying trapped
 CC genes in the isolated cells. The present sequence was used to illustrate
 CC the invention.

XX
 PI Thompson JD, Draper KG;

XX
 DR WPI; 1993-386203/48.

XX New enzymatic RNA molecules (ribozymes) - which cleave mRNA associated
 PT with tumours or mRNA expressed from gene encoding multiple drug
 PT resistance.

PS Claim 3; Fig 8; 69pp; English.

XX The sequences given in AAQ51825-2266 represent areas of mRNAs which are
 CC associated with development or maintenance of chronic myelogenous
 CC leukemia (CML), promyelocytic leukemia, Burkitt's lymphoma, or acute
 CC lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic
 CC leukemia, breast cancer, colon carcinoma, neuroblastoma and lung cancer.
 CC The full length mRNAs containing these target sequences, encode aberrant
 CC cellular proteins which are able to control cellular proliferation and
 CC are directly linked to a leukemic phenotype. These target sequences are
 CC identified by the ribozyme of the invention. The ribozymes is formed in a
 CC hammerhead motif, but may also be formed in the motif of a hairpin,
 CC hepatitis delta virus, group I intron or RNaseP-like RNA. These ribozymes
 CC may be used to inhibit the development or expression of a transformed
 CC phenotype in man and other animals by modulating expression of the
 CC corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic
 CC and transformed cells elicits inhibition of the transformed state.
 CC Multiple drug resistance (mdr-1) mRNA specific ribozymes remove the
 CC mechanism of drug resistance used by transformed cells and thus enhances
 CC drug therapies for tumours. The ribozymes may also be used to study
 CC genetic drift and mutations within cells. (Updated on 25-MAR-2003 to
 CC correct PN field.)

XX PT New enzymatic nucleic acid molecules - cleave RNA produced by e.g. c-myb,
PT for treating restenosis or cancer.
XX PS Claim 1; Page 64; 128pp; English.
XX CC The present sequence represents the preferred target sequence for an
CC enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves
CC the human c-myb sequence at the base position indicated in the descriptor
CC line. The c-myb sequence was screened for optimal ribozyme target sites
CC using a computer folding algorithm, and regions of the mRNA which did not
CC form secondary folding structures and contained potential ribozyme
CC cleavage sites were identified. Ribozymes were synthesised and their
CC activities optimised by either varying the length of the binding arms or
CC by modification to prevent degradation by nucleases. The ribozymes cleave
CC the c-myb sequence and can be used to prevent smooth muscle cell
CC hyperproliferation in restenosis, especially after coronary angioplasty,
CC and in cancers

PT Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
PT stability - useful for treating e.g. tumour angiogenesis, psoriasis,
PT rheumatoid arthritis, etc., in a human patient.
XX
PS Claim 4; Page 167; 218pp; English.
XX
CC The present invention describes nucleic acid molecules which modulate the
CC synthesis, expression and/or stability of a mRNA encoding 1 or more
CC receptors of vascular endothelial growth factor (VEGF). A patient
CC (preferably human) having a condition associated with the level of the
CC fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
CC receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
CC angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
CC treated by administering the nucleic acid molecule or the expression
CC vector to the patient. AAX67275 to AAX75752 represent specific examples
CC of nucleic acid molecules from the present invention

PT New enzymatic nucleic acid(s) - useful for, e.g. reducing alkaloid
PT biosynthesis or regulating flowering.
XX
PS Claim 53; Page 56; 79pp; English.
XX
CC The present invention describes enzymatic nucleic acid molecules with RNA
CC -cleaving activity (e.g. ribozymes) which are capable of modulating the
CC expression of plant genes: (i) involved in biosynthesis of alkaloids; or
CC (ii) involved in flower formation. AAV95982 to AAV96334, and AAV96335 to
CC AAV96354 represent potato solanidine glucosyltransferase hammerhead and
CC hairpin ribozymes, respectively. AAV95629 to AAV95981, and AAV96355 to
CC AAV96734 represent potato solanidine glucosyltransferase target
CC sequences. AAV96773 to AAV97170, and AAV97171 to AAV97195 represent
CC potato citrate synthase hammerhead and hairpin ribozymes, respectively.
CC AAV96735 to AAV96772, and AAV97196 to AAV97220 represent potato citrate
CC synthase target sequences. Ribozymes of the present invention can be used
CC to inhibit the synthesis of toxic alkaloids in solanaceous plants,
CC particularly potato but also tomato, pepper, aubergine and ditura or to
CC inhibit flowering in potato, lettuce, spinach, cabbage, brussel sprouts,
CC arugula, kale, collards, chard, beet, turnip, sweet potato and turf
CC grass. Also the ribozymes can be used for RNA manipulation in the same
CC way that restriction endonucleases are for DNA, as well as to examine
CC genetic drift and mutations in plants and to detect specific RNA. The
CC ribozymes can be targeted to specific genes or to consensus sequences
CC within a family of related genes, and being catalytic need to be present
CC at only very low concentrations

 PT Detection of single nucleotide polymorphisms in genomes by preparation
 PT and analysis of reduced complexity genomes, useful for genotyping,
 PT fingerprinting and determining allele frequency of SNPs.
 XX
 PS Disclosure; Page 72; 111pp; English.
 XX
 CC A method has been developed for detecting the presence or absence of a
 CC single nucleotide polymorphism (SNP) allele in a genomic sample. The
 CC method comprises preparing a reduced complexity genome (RCG) from the
 CC genomic sample and analysing the RCG for the presence or absence of a SNP
 CC allele. The method can be used to characterise a tumour, to generate a
 CC genomic pattern for an individual genome or to generate a genomic
 CC classification code for a genome. The method can be used to assess
 CC whether a subject is at risk for developing a disease or to identify a
 CC set of SNP alleles associated with a disease. The method can also be used
 CC to perform linkage analysis. AAA35944 to AAA35947 represent sequences
 CC used in the exemplification of the present invention. AAA35948 to
 CC AAA36632 represent nucleotide sequences containing SNPs

PT Whole genome sequence of YN87448 virus strain and its cloning method.
XX
PS Claim 3; Page 10; 24pp; Chinese.
XX
CC Primers AAA70578-A70603 were used to RT-PCR amplify the complete genome
CC of the Sindbis-like virus strain YN87448 (AAA70577). The genome was
CC cloned as 15 fragments using these PCR primers for inclusion into the
CC plasmid pGEM-T. The invention relates to the isolation and method of
CC cloning the complete genome for the Sindbis-like virus strain YN87448 by
CC a RT-PCR process. The YN87448 strain virus appears to be the optimal
CC candidate for a vaccine to prevent epidemics of Sindbis encephalitis. The
CC sequence of this strain's genome shows the difference between this viral
CC strain and other epidemic Sindbis virus strains at the molecular level
CC and is useful for understanding the source, evolution and molecular
CC epidemiology of Sindbis viruses. (Updated on 15-SEP-2003 to standardise
CC OS field)

 PT Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
 PT constructs, which down regulate expression of a CD20 gene or neurite
 PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
 PT central nervous system injury.
 XX
 PS Claim 88; Page 66; 200pp; English.
 XX
 CC The invention relates to a nucleic acid molecule which down regulates
 CC expression of a CD20 gene and a nucleic acid molecule which down
 CC regulates expression of a neurite growth inhibitor gene (NOGO). The
 CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
 CC DNzyme) an inozyme (an endolytic nucleic acid cleaving an RNA molecule
 CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or
 CC an amberyzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
 CC with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA
 CC of CD20 in the presence of a divalent cation that is preferably Mg²⁺.
 CC Furthermore, it may be contacted with a cell to reduce CD20 activity of
 CC the cell and treat a patient having a condition associated with the level
 CC of CD20. The treatment may further comprise the use of one or more
 CC therapies. In particular, the CD20 targeting nucleic acid may be used to
 CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
 CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
 CC leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
 CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
 CC immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-

CC targetting nucleic acid is used to cleave RNA of the NOGO gene in the
 CC presence of a divalent cation that is preferably Mg²⁺. Furthermore, the
 CC nucleic acid may be contacted with a cell to reduce NOGO activity of the
 CC cell and treat a patient having a condition associated with the level of
 CC NOGO. The treatment may further comprise the use of one or more
 CC therapies. In particular, the NOGO-targetting nucleic acid may be used to
 CC treat central nervous system (CNS) injury and cerebrovascular accident
 CC (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
 CC Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
 CC disease, muscular dystrophy, and/or other neurodegenerative disease
 CC states which respond to the modulation of NOGO expression. The present
 CC sequence is a hammerhead ribozyme of the invention

 PS Claim 7; Page 215; 294pp; English.
 XX The present invention provides single-stranded oligonucleotides which can
 CC be used for the targeted alteration of genomic sequences, where the
 CC oligonucleotide has at least one mismatch compared with the genomic
 CC sequence to be altered. In particular, these sequences are directed at
 CC the following genes: adenosine deaminase, p53, beta-globin,
 CC retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A
 CC (CDKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus
 CC 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6,
 CC apolipoprotein E (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase

CC (UGT1), amyloid precursor protein (APC), presenilin-1 (PSEN1) and
 CC presenilin-2 (PSEN2). These can be used in the gene therapy of diseases
 CC such as cancer, adenosine deaminase deficiency, cystic fibrosis,
 CC haemophilia, hypercholesterolaemia, thalasassaemia, sickle cell anaemia,
 CC Alzheimer's disease, melanoma, adenomatous polyposis of the colon and
 CC various syndromes. The present sequence is one of the gene correcting
 CC oligonucleotides of the invention

 XX Oligonucleotide for targeted alterations of genetic sequences and for
 PT treating cystic fibrosis, comprises at least one mismatch and chemical
 PT modification.
 XX
 XX Claim 7; Page 232; 294pp; English.
 PS
 XX The present invention provides single-stranded oligonucleotides which can
 CC be used for the targeted alteration of genomic sequences, where the

CC oligonucleotide has at least one mismatch compared with the genomic
 CC sequence to be altered. In particular, these sequences are directed at
 CC the following genes: adenosine deaminase, p53, beta-globin,
 CC retinoblastoma, BRCA1, BRCA2, CTRF, cyclin-dependent kinase inhibitor 2A
 CC (CDKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus
 CC 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6,
 CC apolipoprotein E (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase
 CC (UGT1), amyloid precursor protein (APC), presenilin-1 (PSEN1) and
 CC presenilin-2 (PSEN2). These can be used in the gene therapy of diseases
 CC such as cancer, adenosine deaminase deficiency, cystic fibrosis,
 CC haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia,
 CC Alzheimer's disease, melanoma, adenomatous polyposis of the colon and
 CC various syndromes. The present sequence is one of the gene correcting
 CC oligonucleotides of the invention

XX PT New rice cysteine proteinase gene promoter, useful in stress-induced
 PT regulation of heterologous proteins in plants or plant cells, or as
 PT probes for isolating promoters or genes whose expression stress-induced
 PT or during senescence.

XX PS Disclosure; Col 6; 10pp; English.

XX CC The invention relates to a new promoter derived from rice cysteine
 CC proteinase (CysP) gene (OsEP3A). The promoter directs the expression of a
 CC heterologous protein in the aleurone layer of transgenic rice seeds
 CC during germination and in cultured rice suspension cells under nitrogen
 CC starvation. The nucleic acids can be used as probes to isolate other
 CC promoters and/or genes whose expression is induced under stress or during
 CC senescence, and in stress-induced regulation of heterologous proteins in
 CC plants (including embryos, organs and seeds) or plant cells. The present
 CC sequence represents a PCR primer for amplifying a OsEP3A DNA fragment

XX PT New rice cysteine proteinase gene promoter, useful in stress-induced
 PT regulation of heterologous proteins in plants or plant cells, or as
 PT probes for isolating promoters or genes whose expression stress-induced
 PT or during senescence.

XX PS Example; Page 9; 27pp; English.

XX CC The present invention describes a rice cysteine proteinase (OsEP3A, also
 CC known as CysP) gene promoter. The promoter directs the expression of a
 CC heterologous protein in the aleurone layer of transgenic rice seeds
 CC during germination and in cultured rice suspension cells under nitrogen
 CC starvation. The promoter nucleic acid sequence can be used as a probe to
 CC isolate other promoters and/or genes whose expression is induced under
 CC stress or during senescence, and in stress-induced regulation of
 CC heterologous proteins in plants (including embryos, organs and seeds) or
 CC plant cells. The present sequence represents a PCR primer for rice
 CC OsEP3A, which is used in an example from the present invention

XX New polypeptide, for raising antibodies that recognize hGDMPLP-1 proteins,
PT or as specific biomolecule capture probes for surface-enhanced laser
PT desorption ionization, comprises human myosin-like protein hGDMPLP-1.
XX Disclosure; SEQ ID NO 673; 214pp; English.
XX The present invention describes a human genome-derived myosin-like
CC protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
CC 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
CC nucleic acids can be used as probes to detect, characterize and quantify
CC hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
CC provide initial substrates for the recombinant engineering of hGDMPLP-1
CC protein variants having desired phenotypic improvements, and for
CC expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
CC used as immunogens to raise antibodies that specifically recognise hGDMPLP
CC -1 proteins, as standards in assays used to determine the concentration
CC and/or amount specifically of hGDMPLP proteins, as specific biomolecule
CC capture probes for surface-enhanced laser desorption ionisation, as
CC therapeutic supplement in patients having specific deficiency in hGDMPLP-1
CC production, and in vaccines or for replacement therapy. The
CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
CC disorder associated with the expression of hGDMPLP-1, in particular heart
CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
CC The present sequence represents an oligomer used in the screening of the
CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.

XX New polypeptide, for raising antibodies that recognize hGDMPLP-1 proteins,
 PT or as specific biomolecule capture probes for surface-enhanced laser
 PT desorption ionization, comprises human myosin-like protein hGDMPLP-1.
 XX Disclosure; SEQ ID NO 8033; 214pp; English.

XX The present invention describes a human genome-derived myosin-like
 CC protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
 CC 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
 CC nucleic acids can be used as probes to detect, characterise and quantify
 CC hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
 CC provide initial substrates for the recombinant engineering of hGDMPLP-1
 CC protein variants having desired phenotypic improvements, and for
 CC expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
 CC used as immunogens to raise antibodies that specifically recognise hGDMPLP
 CC -1 proteins, as standards in assays used to determine the concentration
 CC and/or amount specifically of hGDMPLP proteins, as specific biomolecule
 CC capture probes for surface-enhanced laser desorption ionisation, as
 CC therapeutic supplement in patients having specific deficiency in hGDMPLP-1
 CC production, and in vaccines or for replacement therapy. The
 CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
 CC disorder associated with the expression of hGDMPLP-1, in particular heart
 CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.

CC The present sequence represents an oligomer used in the screening of the
 CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
 CC The sequence data for this patent did not form part of the printed
 CC specification, but was obtained in electronic format directly from WIPO

 XX New polypeptide, for raising antibodies that recognize hGDMPLP-1 proteins,
 XX or as specific biomolecule capture probes for surface-enhanced laser
 XX desorption ionization, comprises human myosin-like protein hGDMPLP-1.
 XX Disclosure; SEQ ID NO 1721; 214pp; English.
 XX The present invention describes a human genome-derived myosin-like
 XX protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
 XX 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
 XX nucleic acids can be used as probes to detect, characterise and quantify
 XX hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
 XX provide initial substrates for the recombinant engineering of hGDMPLP-1
 XX protein variants having desired phenotypic improvements, and for
 XX expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
 XX used as immunogens to raise antibodies that specifically recognise hGDMPLP
 XX -1 proteins, as standards in assays used to determine the concentration
 XX and/or amount specifically of hGDMPLP proteins, as specific biomolecule
 XX capture probes for surface-enhanced laser desorption ionisation, as
 XX therapeutic supplement in patients having specific deficiency in hGDMPLP-1
 XX production, and in vaccines or for replacement therapy. The
 XX polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
 XX disorder associated with the expression of hGDMPLP-1, in particular heart
 XX and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
 XX The present sequence represents an oligomer used in the screening of the
 XX hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
 XX The sequence data for this patent did not form part of the printed
 XX specification, but was obtained in electronic format directly from WIPO
 XX at ftp.wipo.int/pub/published_pct_sequence

XX protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
XX 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
XX nucleic acids can be used as probes to detect, characterise and quantify
XX hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
XX provide initial substrates for the recombinant engineering of hGDMPLP-1
XX protein variants having desired phenotypic improvements, and for
XX expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
XX used as immunogens to raise antibodies that specifically recognise hGDMPLP
XX -1 proteins, as standards in assays used to determine the concentration
XX and/or amount specifically of hGDMPLP proteins, as specific biomolecule
XX capture probes for surface-enhanced laser desorption/ionisation, as
XX therapeutic supplement in patients having specific deficiency in hGDMPLP-1
XX production, and in vaccines or for replacement therapy. The
XX polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
XX disorder associated with the expression of hGDMPLP-1, in particular heart
XX and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
XX The present sequence represents an oligomer used in the screening of the
XX hGDMPLP-1 sequence in the exemplification of the present invention. N.B.

PT nutritional value, herbicide or disease resistance, or modified oil
PT production.
XX
XX Claim 7; Page 141; 220pp; English.
XX
XX The invention relates to an oligonucleotide for targeted alteration of a
CC genetic sequence, which comprises a single-stranded oligonucleotide
CC having a DNA domain. The DNA domain has at least one mismatch with
CC respect to the genetic sequence to be altered and further comprises
CC chemical modifications of the oligonucleotide. The chemical modifications
CC consist of o-methyl modification, an LNA modification, two or more
CC phosphorothioate linkages on a terminus, or a combination of any two or
CC more of these modifications. The oligonucleotides are useful for
CC directing repair or alteration of plant genetic information. The
CC oligonucleotides are particularly useful for creating plants with desired
CC phenotypes, e.g. environmental or abiotic stress tolerance, improved
CC nutritional value (e.g. altering amino acid content of plants or
CC conferring amino acid over production), herbicide resistance (e.g.
CC glyphosate resistance, imidazolinone and sulphonylurea herbicide
CC resistance, porphyrin herbicide resistance or triazine resistance),
CC disease resistance, modified oil production, modified starch production
CC (e.g. increased starch or production of waxy starch), altered floral
CC morphology (e.g. male-sterile plants) or modified fatty acid content
CC (e.g. reduced palmitate, increased stearate or reduced linolenic acid).
CC The oligonucleotides are also useful for producing albino mutants for the
CC analysis of photosynthetic processes. This sequence represents a genome
CC altering oligonucleotide of the invention

XX Novel polynucleotide which down regulates expression of Ets-related gene,
 PT useful for treating cancer, diabetic retinopathy, macular degeneration,
 PT arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

XX Claim 4; Page 122; 149pp; English.

XX The invention relates to a nucleic acid molecule (I) which down regulates
 CC expression of an Ets-related gene (ERG). (I) is useful for treating
 CC conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma,
 CC tumour angiogenesis, diabetic retinopathy, macular degeneration,
 CC neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca
 CC vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge
 CC Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu
 CC syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for
 CC treating a patient having a condition associated with the level of ERG,
 CC by contacting cells of the patient with (I) under conditions suitable for
 CC the treatment. The method comprises the use of one or more therapies
 CC under conditions suitable for the treatment. Leukaemia or tumour

CC angiogenesis is treated by administering (I) to the patient in
 CC conjunction with one or more of other therapies such as radiation or
 CC chemotherapy treatment. (I) is useful for reducing ERG activity in a
 CC cell, by contacting the cell with (I). (I) is useful for cleaving RNA of
 CC ERG gene, by contacting (I) with RNA, in the presence of a divalent
 CC cation such as Mg2+. (I) is useful for diagnosis of conditions and
 CC diseases related to the expression of ERG, and as diagnostic tool to
 CC examine genetic drift and mutations within diseased cells or to detect
 CC the presence of ERG RNA in a cell. (I) is useful for specifically
 CC targeting genes that share homology with ERG gene or ERG fusion genes.
 CC ASK17354-ABK22719 represent nucleic acids, including antisense and
 CC enzymatic nucleic acid molecules which regulate expression of ERG, and

XX Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL
PT -1, useful for treating disorders associated with decreased expression or
PT activity of human POSHL1.
XX
PS Example 2; SEQ ID NO 1047; 60pp + Sequence Listing; English.
XX
XX The invention relates to an isolated SH3 domain (POSH)-like signalling
CC protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino
CC acids (SI, AB83999), a sequence having 65% sequence identity to (SI),
CC (SI) having 95% deviations, especially conservative substitutions or a
CC fragment of the sequences comprising at least 8 contiguous amino acids.
CC Human POSHL 1 is a proto-oncogene/oncogene product that functions as an
CC adaptor protein that interacts with Rho family small GTPases as well as
CC downstream components of the signal transduction pathway. (I) is useful
CC for identifying a specific binding partner. (I) and nucleic acids (II)
CC encoding (I) are useful for diagnosing, monitoring disease and treating
CC caused by altered expression of human POSHL1 including diagnosing and
CC treating cancer, they useful in the development of vaccines and (II) is
CC useful in gene therapy. (II) is useful for constructing microarrays which
CC are useful for measuring and for surveying gene expression and creating
CC transgenic non-human animals capable of producing the proteins. The
CC present sequence is that of a scanning oligonucleotide useful in examples
CC of the invention. Note: The present sequence did not form part of the
CC printed specification, but is based on sequence information supplied to
CC Derwent by the European Patent Office

 XX Novel human SH3 domain (POSH)-like signalling protein 1 polypeptide, POSHL
 PT -1, useful for treating disorders associated with decreased expression or
 PT activity of human POSHL1.
 PS Example 2; SEQ ID NO 1046; 60pp + Sequence Listing; English.
 XX The invention relates to an isolated SH3 domain (POSH)-like signalling
 CC protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino
 CC acids (SI, ABB83999), a sequence having 65% sequence identity to (SI),
 CC (SI) having 95% deviations, especially conservative substitutions or a
 CC fragment of the sequences comprising at least 8 contiguous amino acids.
 CC Human POSHL 1 is a proto-oncogene/oncogene product that functions as an
 CC adaptor protein that interacts with Rho family small GTPases as well as
 CC downstream components of the signal transduction pathway. (I) is useful
 CC for identifying a specific binding partner. (I) and nucleic acids (II)
 CC encoding (I) are useful for diagnosing, monitoring disease and treating
 CC caused by altered expression of human POSHL1 including diagnosing and
 CC treating cancer, they useful in the development of vaccines and (II) is
 CC useful in gene therapy. (II) is useful for constructing microarrays which
 CC are useful for measuring and for surveying gene expression and creating
 CC transgenic non-human animals capable of producing the proteins. The
 CC present sequence is that of a scanning oligonucleotide useful in examples
 CC of the invention. Note: The present sequence did not form part of the
 CC printed specification, but is based on sequence information supplied to

 XX

CC The invention relates to an isolated SH3 domain (POSH)-like signalling
 CC protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino
 CC acids (SI, AB883999), a sequence having 65% sequence identity to (SI),
 CC (SI) having 95% deviations, especially conservative substitutions or a
 CC fragment of the sequences comprising at least 8 contiguous amino acids.
 CC Human POSHL 1 is a proto-oncogene/oncogene product that functions as an
 CC adaptor protein that interacts with Rho family small GTPases as well as

CC downstream components of the signal transduction pathway. (I) is useful
 CC for identifying a specific binding partner. (I) and nucleic acids (II)
 CC encoding (I) are useful for diagnosing, monitoring disease and treating
 CC caused by altered expression of human POSHL1 including diagnosing and
 CC treating cancer, they are useful in the development of vaccines and (II) is
 CC useful in gene therapy. (II) is useful for constructing microarrays which
 CC are useful for measuring and for surveying gene expression and creating
 CC transgenic non-human animals capable of producing the proteins. The
 CC present sequence is that of a scanning oligonucleotide useful in examples
 CC of the invention. Note: The present sequence did not form part of the
 CC printed specification, but is based on sequence information supplied to
 CC Derwent by the European Patent Office

XX PT Enzymatic polynucleotide that down regulates expression of chloride
 PT channel calcium activated gene, useful for treating Chronic obstructive
 PT pulmonary disease (COPD), chronic bronchitis and asthma.

XX PS Claim 4; Page 88; 152pp; English.

XX CC The invention relates to enzymatic nucleic acid molecules that down
 CC regulate expression of chloride channel calcium activated 1 (CLCA1) genes
 CC by cleaving RNA derived from the genes. The nucleic acid sequences are
 CC useful as pharmaceutical agents for treating conditions such as chronic
 CC obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic
 CC fibrosis, obstructive bowel syndrome and any other diseases or conditions
 CC that are related to or will respond to the levels of CLCA1 in a cell or
 CC tissue. The sequences are useful for reducing CLCA1 activity in a cell,

CC hence, are useful for treatment of a patient having a condition
 CC associated with the level of CLCA1, where the invention further comprises
 CC the use of one or more therapies under conditions suitable for the
 CC treatment, for example, oxygen therapy, bronchodilators, corticosteroids,
 CC antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The
 CC nucleic acids of the invention are also used as diagnostic tools to
 CC examine genetic drift and mutations within diseased cells or to detect
 CC the presence of CLCA1 RNA in a cell. This sequence represents an
 CC enzymatic nucleic acid molecule of the invention

XX
XX New nucleic acid molecule that modulates replication of West Nile Virus
PT (WNV), useful for treating a condition related to WNV infection e.g.
PT pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
XX
XX Claim 23; SEQ ID NO 5005; 495pp; English.
XX
XX The invention relates to nucleic acid molecules that modulate replication
CC of the West Nile Virus (WNV). The nucleic acid molecules are useful for
CC treating a condition related to WNV infection e.g. pancreatitis,
CC encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
CC liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid
CC molecule is selected from the group of ribozymes consisting of
CC Hammerhead, Inozyme, G-cleaver, DNzyme, Amberzyme and Zinzyme. The
CC nucleic acid molecules further comprise at least five ribose residues, at
CC least ten 2'-O-methyl modifications, phosphorothioate linkages on at
CC least three of the 5' terminal nucleotides and a 3' end modification of a
CC 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
CC are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
CC in the specification. The present sequence is that of a nucleic acid
CC molecule of the invention

XX New nucleic acid molecule that modulates replication of West Nile Virus
 PT (WNV), useful for treating a condition related to WNV infection e.g.
 PT pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
 XX Claim 23; SEQ ID NO 8872; 495pp; English.

XX The invention relates to nucleic acid molecules that modulate replication
 CC of the West Nile Virus (WNV). The nucleic acid molecules are useful for
 CC treating a condition related to WNV infection e.g. pancreatitis,
 CC encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
 CC liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid
 CC molecule is selected from the group of ribozymes consisting of
 CC Hammerhead, Inozyme, G-cleaver, DNazyme, Amberzyme and Zinzyme. The
 CC nucleic acid molecules further comprise at least five ribose residues, at
 CC least ten 2'-O-methyl modifications, phosphorothioate linkages on at
 CC least three of the 5' terminal nucleotides and a 3' end modification of a
 CC 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
 CC are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
 CC in the specification. The present sequence is that of a nucleic acid
 CC molecule of the invention

CC The invention relates to a novel isolated 17 mer nucleic acid sequence,

CC given in the specification, a sequence containing at least 15 consecutive

CC nucleotides from the 17 mer sequence, a sequence with, after optimal

CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that

CC hybridizes to them under highly stringent conditions, or the complement

CC of any of them, or the corresponding RNA. The novel isolated nucleic

CC acids of the invention are useful as probes and primers for detecting,

CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one

CC component of a gene chip, in vitro as (anti)sense reagents, and for

CC production of recombinant polypeptides. Any of the nucleic acids,
 CC polypeptides, vectors containing the nucleic acids, cells containing the
 CC vector or antibodies directed against the polypeptides are useful for
 CC preparation of pharmaceuticals for prevention and/or treatment of viral
 CC diseases that are characterized by development of tumours or cell
 CC degeneration, specifically cancer but also Alzheimer's disease and
 CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
 CC patient samples is useful for diagnosis and/or prognosis of these
 CC diseases. The polypeptides can also be used to generate antibodies, and
 CC both the polypeptide and antibodies are useful as components of protein
 CC chips. The nucleic acid sequences of the invention can be used in gene
 CC therapy. The nucleic acid sequences of the invention can be used in gene
 CC therapy. This polynucleotide sequence represents a tumour suppression
 CC related human fukutin oligonucleotide of the invention

 XX
 SS The invention relates to a novel isolated 17 mer nucleic acid sequence,
 CC given in the specification, a sequence containing at least 15 consecutive
 CC nucleotides from the 17 mer sequence, a sequence with, after optimal
 CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that
 CC hybridizes to them under highly stringent conditions, or the complement
 CC of any of them, or the corresponding RNA. The novel isolated nucleic
 CC acids of the invention are useful as probes and primers for detecting,
 CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
 CC component of a gene chip, in vitro as (anti)sense reagents, and for
 CC production of recombinant polypeptides. Any of the nucleic acids,
 CC polypeptides, vectors containing the nucleic acids, cells containing the
 CC vector or antibodies directed against the polypeptides are useful for
 CC preparation of pharmaceuticals for prevention and/or treatment of viral

CC diseases that are characterised by development of tumours or cell
CC degeneration, specifically cancer but also Alzheimer's disease and
CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC patient samples is useful for diagnosis and/or prognosis of these
CC diseases. The polypeptides can also be used to generate antibodies, and
CC both the polypeptide and antibodies are useful as components of protein
CC chips. The nucleic acid sequences of the invention can be used in gene
CC therapy. This polynucleotide sequence represents a tumour suppression
CC related human fukutin oligonucleotide of the invention

PS
XX The invention describes an enzymatic nucleic acid molecule (I) which down

CC regulates expression of a sequence encoding a subunit of nuclear factor
CC kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme
CC configuration. The enzymatic nucleic acid molecule is adapted to treat
CC cancer and is useful for down-regulating REL-A activity in a cell, for
CC treating a patient having a condition associated with the level of REL-A.
CC (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in
CC the presence of a divalent cation, especially Mg²⁺. The enzymatic and
CC antisense nucleic acid molecules are useful for treating breast, lung,
CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,
CC cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or
CC multidrug resistant cancer. The method involves use of other drug
CC therapies such as monoclonal antibodies, REL-A-specific inhibitors or
CC chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate,
CC cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate,
CC gemcitabine or radiation therapy. The enzymatic and antisense nucleic
CC acid molecules are also useful for treating inflammatory disease such as
CC rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,
CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
CC rejection, gene therapy applications, ischaemia/reperfusion injury
CC (central nervous system (CNS) and myocardial), glomerulonephritis,
CC sepsis, allergic airway inflammation, inflammatory bowel disease or
CC infection. This sequence represents the substrate of a novel enzymatic
CC nucleic acid molecule

XX
CC      The invention relates to a novel short interfering RNA (siRNA) nucleic
CC      acid molecule or an enzymatic nucleic acid molecule, that modulates
CC      expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras,
CC      human immunodeficiency virus (HIV) or a component of HIV. The nucleic
CC      acid molecule of the invention has cytosstatic, anti-HIV, and anti-
CC      rheumatic activity. The nucleic acid molecules are useful for reducing
CC      HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are
CC      also useful for treating breast, ovarian, colorectal, lung, prostate,
CC      bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences
CC      shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524,
CC      ABZ66530 - ABZ66585 represent substrate/target sequences for the human
CC      ribozymes of the invention

XX
XX The present invention relates to nucleic acid molecules which modulate
CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
CC and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,
CC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse
CC transcriptase and/or HBV reverse transcriptase primer sequences, as well
CC as oligonucleotides that specifically bind the Enhancer I region of HBV
CC DNA. The nucleic acids may be used to modulate the expression of HBV
CC genes and HBV viral replication. Also disclosed is a method for screening
CC compounds and/or potential therapies directed against HBV, and compounds
CC that modulate the expression and/or replication of HCV. The compounds and
CC methods of the invention are useful for the treatment of degenerative and
CC disease states related to HBV and HCV infection, replication and gene
CC expression such as cirrhosis, liver failure, and hepatocellular
CC carcinoma. The present sequence represents a substrate for one of the HBV
CC ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences
CC disclosed in the present invention

Novel compound useful for treating cirrhosis, liver failure,
 hepatocellular carcinoma, or condition associated with hepatitis C virus
 infection.

Example 1; Page 164; 387pp; English.

The present invention relates to nucleic acid molecules which modulate
 the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
 Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
 and enzymatic nucleic acids such as hammerhead ribozymes, DNazymes,
 inozymes, zinzymes, amberyne, and G-cleaver ribozymes. Also disclosed
 are nucleic acid decoy molecules and aptamers that bind to HBV reverse
 transcriptase and/or HBV reverse transcriptase primer sequences, as well
 as oligonucleotides that specifically bind the Enhancer I region of HBV
 DNA. The nucleic acids may be used to modulate the expression of HBV
 genes and HBV viral replication. Also disclosed is a method for screening
 compounds and/or potential therapies directed against HBV, and compounds
 that modulate the expression and/or replication of HCV. The compounds and
 methods of the invention are useful for the treatment of degenerative and
 disease states related to HBV and HCV infection, replication and gene

CC expression such as cirrhosis, liver failure, and hepatocellular
 CC carcinoma. The present sequence represents a substrate for one of the HBV
 CC ribozyme, inozyme, G-cleaver, zinzyme, DNazyme or amberyne sequences
 CC disclosed in the present invention

PS Disclosure; Page 424; 771pp; French.

XX

XX The invention relates to the isolation of 6327 nucleotide sequences,

XX fragments of at least 15 consecutive nucleotides of these nucleotides, a

XX sequence having at least 80% identity, after optimal alignment, with the

XX nucleotides, a sequence that hybridizes under stringent conditions with

XX the nucleotides, or the complement, or corresponding RNA, of the

XX nucleotides. The nucleotides are used as probes or primers for detecting,

XX identifying, quantifying and/or amplifying nucleic acids, as in vitro

XX sense and antisense sequences, of nucleotides involved in tumour

XX suppression or reversion, apoptosis and or viral resistance, to produce

XX recombinant polypeptides, and to prepare transgenic animals, as

XX experimental models. The nucleotides (also vectors containing them and

XX cells containing the vectors), the encoded polypeptides and antibodies

XX (Ab) against the polypeptide are useful for prevention and/or treatment

XX of viral infections or diseases characterized by development of tumours

XX or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

XX Analysis of the expression of the nucleotides can be used for diagnosis

XX and/or prognosis of these diseases. The nucleotides and polypeptides can

XX also be used to screen for their specific interactive molecules,

XX potentially useful for treating diseases associated with abnormal

XX expression of the nucleotides.

PS
XX
XX The invention relates to the isolation of 6327 nucleotide sequences,
CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC

```

CC sequence having at least 80% identity, after optimal alignment, with the
CC nucleotides, a sequence that hybridizes under stringent conditions with
CC the nucleotides, or the complement, or corresponding RNA, of the
CC nucleotides. The nucleotides are used as probes or primers for detecting,
CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC sense and antisense sequences, of nucleotides involved in tumour
CC suppression or reversion, apoptosis and or viral resistance, to produce
CC recombinant polypeptides, and to prepare transgenic animals, as
CC experimental models. The nucleotides (also vectors containing them and
CC cells containing the vectors), the encoded polypeptides and antibodies
CC (Ab) against the polypeptide are useful for prevention and/or treatment
CC of viral infections or diseases characterized by development of tumours
CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC Analysis of the expression of the nucleotides can be used for diagnosis
CC and/or prognosis of these diseases. The nucleotides and polypeptides can
CC also be used to screen for their specific interactive molecules,
CC potentially useful for treating diseases associated with abnormal
CC expression of the nucleotides.

PT Novel polynucleotide useful for detecting single nucleotide polymorphisms
in human gene.
PS Claim 2; SEQ ID NO 1250; 704pp; Japanese.
XX
CC The invention relates to a novel polynucleotide isolated and purified
from a human gene having any one of 935 fully defined sequences as given
in specification, or a sequence having a base substitution. The invention
further relates to: an oligonucleotide containing single nucleotide
polymorphisms; a PCR primer set chosen from the combination of two DNA
fragments from any one of 1220 fully defined sequences as given in
specification; a labelling probe containing the SNP containing oligo; and
a microarray equipped with the SNP containing oligo. The isolated human
gene of the invention is useful for detecting the single nucleotide
polymorphisms in human gene. The isolated human gene is also useful for
diagnosis of disease and determination of side effect to a medical agent.
CC The isolated human gene is also effective in detecting single nucleotide
polymorphisms in a human gene. This polynucleotide sequence represents
one of the PCR primers used in the single nucleotide polymorphism
detection method of the invention.

XX
PS Disclosure; SEQ ID NO 2270; 30pp; French.
XX
CC This invention relates to novel isolated nucleic acid sequences involved
in the phenomena of tumour suppression, tumour reversion, apoptosis
and/or resistance to viruses. The invention may be useful for the
development of compounds with a cytostatic, virucide, neuroprotective,
nontropic or neuroleptic activity. The DNA sequences may be useful as
probes and primers for detecting, identifying, quantifying and/or
amplifying nucleic acid, for example as one component of a gene chip, in
vitro as antisense reagents and for production of recombinant
polypeptides. The invention may therefore be useful for preparation of
pharmaceuticals for prevention and/or treatment of viral diseases that
are characterised by development of tumours or cell degeneration, but also Alzheimer's disease and schizophrenia. The

CC nontropic or neuroleptic activity. The DNA sequences may be useful as
probes and primers for detecting, identifying, quantifying and/or
amplifying nucleic acid, for example as one component of a gene chip, in
vitro as antisense reagents and for production of recombinant
polypeptides. The invention may therefore be useful for preparation of
pharmaceuticals for prevention and/or treatment of viral diseases that
are characterised by development of tumours or cell degeneration, but also Alzheimer's disease and schizophrenia. The
present sequence is that of a nucleic acid sequence of the invention.

 XX Novel enzymatic nucleic acid that down-regulates expression of neurite
 PT growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
 PT protein kinase PKR genes, for treating cancer and inflammatory disease.
 XX
 PS Claim 9; SEQ ID NO 65; 317pp; English.

XX The invention comprises nucleic acids (e.g. antisense oligonucleotides)
 CC that down regulate the expression or inhibit the function of a receptor
 CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
 CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
 CC invention are useful for treating: cerebrovascular accident, central
 CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
 CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
 CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
 CC disease, lupus, multiple sclerosis, transplant/graft rejection,
 CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
 CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
 CC nucleic acids of the invention are also useful for down-regulating the
 CC expression of a target gene and as a diagnostic tool to examine genetic
 CC drifts and mutations within diseased cells or to detect the presence of a
 CC target RNA in a cell. The present RNA sequence represents a human NOGO
 CC receptor hammerhead ribozyme substrate sequence.

XX
XX Novel enzymatic nucleic acid that down-regulates expression of neurite
PT growth inhibitor receptor, prostaglandin D2 receptor, ikappaB kinase or
PT protein kinase PKR genes, for treating cancer and inflammatory disease.
XX
XX Claim 59; SEQ ID NO 3451; 317pp; English.
XX
XX The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC ikappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC nucleic acids of the invention are also useful for down-regulating the
CC expression of a target gene and as a diagnostic tool to examine genetic
CC drifts and mutations within diseased cells or to detect the presence of a
CC target RNA in a cell. The present RNA sequence represents a human PKR
CC substrate sequence.

XX DR
XX PT Novel enzymatic nucleic acid that down-regulates expression of neurite
XX PT growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
XX PT protein kinase PKR genes, for treating cancer and inflammatory disease.
XX PS Claim 9; SEQ ID NO 377; 317pp; English.
XX CC The invention comprises nucleic acids (e.g. antisense oligonucleotides)
XX CC that down regulate the expression or inhibit the function of a receptor
XX CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
XX CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
XX CC invention are useful for treating: cerebrovascular accident, central
XX CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
XX CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
XX CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
XX CC disease, lupus, multiple sclerosis, transplant/graft rejection,
XX CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
XX CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
XX CC nucleic acids of the invention are also useful for down-regulating the
XX CC expression of a target gene and as a diagnostic tool to examine genetic
XX CC drifts and mutations within diseased cells or to detect the presence of a
XX CC target RNA in a cell. The present RNA sequence represents a human NOGO
XX CC receptor inozyme substrate sequence.

XX Novel enzymatic nucleic acid that down-regulates expression of neurite
PT growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
PT protein kinase PKR genes, for treating cancer and inflammatory disease.
XX
XX Claim 9; SEQ ID NO 695; 317pp; English.
XX
XX The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC nucleic acids of the invention are also useful for down-regulating the
CC expression of a target gene and as a diagnostic tool to examine genetic
CC drifts and mutations within diseased cells or to detect the presence of a
CC target RNA in a cell. The present RNA sequence represents a human NOGO
CC receptor zinzyme substrate sequence.

XX New nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and

PT leukemia.

XX Claim 4; SEQ ID NO 874; 74pp; English.

PS The invention relates to a nucleic acid molecule that down-regulates

XX expression of Grb2-related with insert domain (GRID) gene, e.g. a

CC hammerhead ribozyme, NCH ribozyme, G-cleaver ribozyme, Zinzyme, DNasezyme,

CC amberyzyme, inozyme or hairpin ribozyme. Also include are a mammalian cell

CC including the novel nucleic acid molecule, reducing GRID activity in a

CC cell by contacting the cell with the novel nucleic acid molecule,

CC treating a patient having a condition associated with the level of GRID

CC (e.g. tissue/graft rejection or leukaemia) by contacting the cell with

CC the novel nucleic acid molecule, cleaving RNA of a GRID gene by

CC contacting the cell with the novel nucleic acid molecule, an expression

CC vector comprising a nucleic acid sequence (encoding at least the novel

CC nucleic acid molecule) in a manner that allows its expression), a

CC mammalian cell including the expression vector and an enzymatic nucleic

CC acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid

CC molecule is useful for treating a condition associated with the level of

CC GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is

CC a target region for the enzymatic nucleic acids of the invention.

XX
XX Identifying molecule that modulates biological activity of native
PT quadruplex DNA, by contacting test quadruplex DNA with candidate
PT molecule, determining presence or absence of interaction between the
PT molecule and test quadruplex DNA.
XX
XX Claim 2; Page 36; 43pp; English.
XX
XX The invention relates to a method of identifying (M1) a molecule that
CC modulates biological activity of native quadruplex DNA, by contacting
CC test quadruplex DNA with candidate molecule, and determining presence or
CC absence of interaction between candidate molecule and test quadruplex
CC DNA, where candidate molecule that interacts with test quadruplex DNA is
CC identified as molecule that modulates biological activity of native
CC quadruplex DNA. (M1) is useful for identifying molecule that modulates
CC biological activity of native quadruplex DNA (claimed). (M1) is useful
CC for identifying molecule that modulates biological activity of native
CC quadruplex DNA, where the identified molecule stabilizes quadruplex
CC structure which can exert a therapeutic effect for certain cell
CC proliferative disorders e.g., colorectal cancer, leukemia's, Hodgkin's
CC disease, etc. This sequence corresponds to a test quadruplex molecule
CC used in the method of the invention.

XX Identifying a cell with a desired oligonucleotide-directed sequence
PT alteration at a nucleic acid target site within the cell by identifying
PT the desired sequence alteration in cells selected for the presence of a
PT selectable phenotype.
XX
XX Example 28; SEQ ID NO 1623; 303pp; English.
XX
XX This invention relates to a novel method of identifying a cell having a
CC desired oligonucleotide-directed sequence alteration at a first nucleic
CC acid target site within the cell. The method comprises identifying the
CC desired sequence alteration in cells that have been selected for the
CC presence of a selectable phenotype conferred by a concurrent
CC oligonucleotide-directed sequence alteration at a second nucleic acid
CC target site within the cells. The method is useful in identifying a cell
CC having a desired oligonucleotide-directed sequence alteration at a first
CC nucleic acid target site within the cell. The method may be useful for
CC the production of plants with herbicide resistance, male or female
CC sterile plants, abiotic stress tolerance, albino plants or plants with
CC altered amino acid production as well as for use in mammalian cell lines.
CC The present sequence is that of a mutagenic oligonucleotide which was
CC used in the exemplification of the invention.

XX
XX Novel myosin-like protein-1, useful for treating or preventing disorder
PT associated with decreased expression or activity of human genome-derived
PT myosin-like protein-1 such as disorder of heart and/or skeletal muscle
PT function.
XX
XX Disclosure; SEQ ID NO 7814; Opp; English.
XX
XX The invention relates to a novel polypeptide (I) comprising a sequence
CC (S1) of myosin-like protein-1 (hGDMPLP-1) having 2568 amino acids fully
CC defined in the specification, a fragment of at least 8 amino acids of
CC (S1), 95% deviation from (S1) which are conservative substitutions, and
CC 65% identity to (S1). A polypeptide of the invention acts as an agonist or
CC antagonist of hGDMPLP-1, or as an inhibitor of hGDMPLP-1 activity. A
CC pharmaceutical composition of the invention is useful for treating or
CC preventing a disorder associated with decreased expression or activity of
CC hGDMPLP-1, such as a disorder of heart and/or skeletal muscle function.
CC The present sequence represents a 17-mer nucleotide, used in the
CC invention for scanning the sequence represented in ACN63103

 XX
 XX Novel myosin-like protein-1, useful for treating or preventing disorder
 XX associated with decreased expression or activity of human genome-derived
 XX myosin-like protein-1 such as disorder of heart and/or skeletal muscle
 XX function.
 XX
 XX Disclosure; SEQ ID NO 1997; Opp; English.
 XX
 XX The invention relates to a novel polypeptide (I) comprising a sequence
 XX (S1) of myosin-like protein-1 (hGDMPLP-1) having 2568 amino acids fully
 XX defined in the specification, a fragment of at least 8 amino acids of
 XX (S1), 95% deviation from (S1) which are conservative substitutions, and
 XX 65% identity to (S1). A polypeptide of the invention acts as an agonist or
 XX antagonist of hGDMPLP-1, or as an inhibitor of hGDMPLP-1 activity. A
 XX pharmaceutical composition of the invention is useful for treating or
 XX preventing a disorder associated with decreased expression or activity of
 XX hGDMPLP-1, such as a disorder of heart and/or skeletal muscle function.
 XX The present sequence represents a 17-mer nucleotide, used in the
 XX invention for scanning the sequence represented in ACN63102

XX Novel myosin-like protein-1, useful for treating or preventing disorder

PT associated with decreased expression or activity of human genome-derived
 PT myosin-like protein-1 such as disorder of heart and/or skeletal muscle
 PT function.

XX Disclosure; SEQ ID NO 6890; Opp; English.

XX The invention relates to a novel polypeptide (I) comprising a sequence
 CC (S1) of myosin-like protein-1 (hGDMPLP-1) having 2568 amino acids fully
 CC defined in the specification, a fragment of at least 8 amino acids of
 CC (S1), 95% deviation from (S1) which are conservative substitutions, and
 CC 65% identity to (S1). A polypeptide of the invention acts as an agonist or
 CC antagonist of hGDMPLP-1, or as an inhibitor of hGDMPLP-1 activity. A
 CC pharmaceutical composition of the invention is useful for treating or
 CC preventing a disorder associated with decreased expression or activity of
 CC hGDMPLP-1, such as a disorder of heart and/or skeletal muscle function.
 CC The present sequence represents a 17-mer nucleotide, used in the
 CC invention for scanning the sequence represented in ACN63103

XX Identifying an individual who has altered risk for developing stenosis
 PT comprises detecting single nucleotide polymorphism (SNP), in the
 PT individual's nucleic acids.

XX Claim 19; SEQ ID NO 67974; 146pp; English.

XX The invention relates to identifying an individual who has altered risk
 CC for developing coronary stenosis comprising detecting a single nucleotide
 CC polymorphism (SNP) in any one of the 67073 nucleotide sequences (not
 CC given in the specification), in the individual's nucleic acids, where the
 CC presence of the SNP is correlated with an altered risk for stenosis in
 CC the individual. Also included are an isolated nucleic acid molecule
 CC comprising at least 8 contiguous nucleotides where one of the
 CC nucleotides is an SNP as cited above, or their complement, an isolated
 CC polypeptide comprising an amino acid sequence selected from any of the
 CC 696 amino acid sequences (not defined in the specification), an antibody
 CC that specifically binds to the polypeptide (or its antigen-binding
 CC fragment), an amplified polynucleotide containing the SNP as cited (where
 CC the amplified polynucleotide is between about 16 and about 1,000
 CC nucleotides in length), an isolated polynucleotide which specifically
 CC hybridises to a nucleic acid molecule containing the SNP, a kit for
 CC detecting a SNP in a nucleic acid, detecting a SNP in a nucleic acid
 CC molecule, detecting a variant polypeptide and identifying an agent useful
 CC in therapeutically or prophylactically treating stenosis. The detection
 CC step of the method is carried out by a process selected from allele-
 CC specific probe hybridisation, allele-specific primer extension, allele-
 CC specific amplification, sequencing, 5' nuclease digestion, molecular
 CC beacon assay, oligonucleotide ligation assay, size analysis, and single-
 CC stranded conformation polymorphism. The method is useful for identifying
 CC an individual who has altered risk for developing coronary stenosis,
 CC which can lead to angina (ischaemic chest pain), myocardial infarction
 CC and ultimately sudden cardiac death. The present sequence is an allele
 CC specific primer for amplifying a SNP-containing region of a human marker
 CC gene associated with stenosis. NOTE: SEQ ID 1-67771 are not shown in the
 CC specification but are provided on a CD-R named CL001510CDR which was not
 CC supplied with the specification.

PCR was performed on DNA from transformants of Arabidopsis thaliana
plants from INRA (Versailles). The DNA fragment(s) resulting from
the PCR were directly sequenced from the left or the right border
to determine the genomic sequence flanking the insertion. T-DNA
derived sequences were removed. Information to order the
corresponding mutant line and a link to a database providing a
graphical display of the insertion site are available at
http://dbsgap.versailles.inra.fr/publiclines/. This sequence has
been generated in the framework of the French plant genomics
program 'Genoplante' (http://www.genoplante.com and

JOURNAL Submitted (23-OCT-2003) Balzerque S., UMRGV, INRA/CNRS, 2 rue
Gaston Cremieux, 91057 Evry cedex, FRANCE
COMMENT PCR was performed on DNA from transformants of Arabidopsis thaliana
plants from INRA (Versailles). The DNA fragment(s) resulting from
the PCR were directly sequenced from the left or the right border
to determine the genomic sequence flanking the insertion. T-DNA
derived sequences were removed. Information to order the
corresponding mutant line and a link to a database providing a
graphical display of the insertion site are available at
http://dbgap.versailles.inra.fr/publiclines/. This sequence has
been generated in the framework of the French plant genomics

program 'Genoplante' (<http://www.genoplante.com> and

JOURNAL
Submitted (23-OCT-2003) Balzerque S., UMRGV, INRA/CNRS, 2 rue
Gaston Crenieux, 91057 Evry cedex, FRANCE
COMMENT
PCR was performed on DNA from transformants of Arabidopsis thaliana
plants from INRA (Versailles). The DNA fragment(s) resulting from
the PCR were directly sequenced from the left or the right border
to determine the genomic sequence flanking the insertion. T-DNA
derived sequences were removed. Information to order the
corresponding mutant line and a link to a database providing a
graphical display of the insertion site are available at
http://dbsgap.versailles.inra.fr/publiclines/. This sequence has
been generated in the framework of the French plant genomics
program 'Genoplatte' (http://www.genoplatte.com and
http://genoplatte-info.infobiogen.fr).
